Letters intended for publication should be a maximum of 500 words, 10 references, and one table or figure, and should be sent to the editor at the address given on the inside front cover. Those responding to articles or correspondence published in the journal should be received within six weeks of publication.

Listening between the lines: what BAT really thinks of its consumers in the developing world

In an audio recording of the “Structured Creativity Conference” held in Hampshire, UK in June 1984, British American Tobacco (BAT) adds context to the written report of marketing and product applications. Employees are taped brainstorming creative ways to push their product in light of future marketing constraints and social pressure towards a smoke-free society. Project proposals included the following: low sidestream smoke; smoke-free society. Project proposals included the following: low sidestream smoke, “front end lift” cigarette design to give the smoker more “impact” on the first puff, pleasant smelling sidestream smoke, and nicotine inhalers—“Forget about smoking . . . GO FOR A QUICK EEG. No tar with nicotine, and nicotine inhalers—“Forget about smoking and product applications. Creativity Conference” held in Hampshire, UK in June 1984.

Eclipse: does it live up to its health claims?

We read the recent article by Slade et al with great interest and agree that reasonable regulation focused on the development and appropriate evaluation of potentially reduced risk cigarettes is warranted. Furthermore, we agree with Slade et al that the results of our evaluation indicate that Eclipse may offer potential benefits to smokers. However, we disagree with several of the other conclusions drawn by the authors.

The article challenges the merits of Eclipse and questions the fundamental differences between Eclipse and other cigarettes. It is not possible within the context of this letter either to fully describe the scientific data that has been developed to characterise Eclipse or to address many of the criticisms raised in Slade’s article. However, we briefly address pertinent issues below and encourage interested parties to independently evaluate all of the available information.

Slade et al have inaccurately represented the claims that RJ Reynolds Tobacco Company (RJRT) has made regarding Eclipse. No cigarette is without risk, including Eclipse. Our advertising for Eclipse states: “The best choice for smokers who worry about their health is to quit. But Eclipse is the next best choice for those who have decided to continue smoking.” Our advertising also makes it clear that RJRT does not claim that Eclipse offers a risk free or reduced risk of cardiovascular disease or complications with pregnancy.

In the absence of any existing regulatory standard, RJRT assumed Eclipse’s risk reduction potential using a four step scientific methodology that included chemical testing and analysis, biological and toxicological testing, human testing, and independent scientific verification. In general, the evaluation strategy utilised was consistent with strategies outlined by the Institute of Medicine Committee that addressed this subject. RJRT has conducted an extensive comparative evaluation of Eclipse and has presented this research at scientific meetings in the both the USA and internationally. The results of these and other studies may be reviewed on the Eclipse website (www.eclipsescience.com).

In addition, much of this research has been published in the peer reviewed literature. The weight of the evidence from this research clearly shows that, compared to other cigarettes, Eclipse may present smokers with less risk of cancer, chronic bronchitis, and possibly cardiovascular disease. The article challenges the merits of Eclipse and questions the fundamental differences between Eclipse and other cigarettes. It is not possible within the context of this letter either to fully describe the scientific data that has been developed to characterise Eclipse or to address many of the criticisms raised in Slade’s article. However, we briefly address pertinent issues below and encourage interested parties to independently evaluate all of the available information.

Slade et al have inaccurately represented the claims that RJ Reynolds Tobacco Company (RJRT) has made regarding Eclipse. No cigarette is without risk, including Eclipse. Our advertising for Eclipse states: “The best choice for smokers who worry about their health is to quit. But Eclipse is the next best choice for those who have decided to continue smoking.” Our advertising also makes it clear that RJRT does not claim that Eclipse offers a risk free or reduced risk of cardiovascular disease or complications with pregnancy.

In the absence of any existing regulatory standard, RJRT assumed Eclipse’s risk reduction potential using a four step scientific methodology that included chemical testing and analysis, biological and toxicological testing, human testing, and independent scientific verification. In general, the evaluation strategy utilised was consistent with strategies outlined by the Institute of Medicine Committee that addressed this subject. RJRT has conducted an extensive comparative evaluation of Eclipse and has presented this research at scientific meetings in the both the USA and internationally. The results of these and other studies may be reviewed on the Eclipse website (www.eclipsescience.com).

In addition, much of this research has been published in the peer reviewed literature. The weight of the evidence from this research clearly shows that, compared to other cigarettes, Eclipse may present smokers with less risk of cancer, chronic bronchitis, and possibly emphysema. An independent panel of scientific experts reviewed the science and reached conclusions consistent with RJRT’s claims.

RJRT’s comparative studies were conducted using Kentucky reference cigarettes (K1RF and K1RF) and leading low “tar” and ultra low “tar” commercial brand styles. Combined, the cigarettes selected for comparison to Eclipse are representative of the vast majority of cigarettes sold in the US market. By contrast the entire market segment of the very low yielding ultra low “tar” cigarettes used by Slade et al as a comparison collectively represent less than 1% of the market. Furthermore, one of the two cigarettes selected as a comparison (Now Box) does not have a measurable US Federal Trade Commission (FTC) “tar” yield.

References

Comparisons of Eclipse mainstream smoke constituent yields to the yields of very low yielding ultra low "tar" cigarettes (New Box and Carlton Soft Pack) obtained by machine smoking do not change the fact that Eclipse cigarettes may present smokers with less risk of certain smoking related diseases than other cigarettes. RJRT scientists have recently demonstrated Eclipse is significantly less mutagenic under the same range of machine smoking conditions. In addition, Eclipse was significantly less mutagenic on a per mg "tar" basis than either Carlton Soft Pack or New Box over a wide range of machine smoking conditions. On a per cigarette basis, Eclipse was less mutagenic than Carlton Soft Pack under all machine smoking conditions tested and was less mutagenic than New Box when evaluated using the machine smoking conditions mandated by both the Massachusetts Department of Health and the Canadian federal government. In addition, Eclipse was significantly less cytotoxic on both a per mg "tar" basis and a per cigarette basis under the same range of machine smoking conditions.

As noted by Slade et al., smokers typically take larger and more frequent puffs than those specified by the US Federal Trade Commission puffing regimen and they typically smoke Eclipse differently than their usual brand. Therefore, it is essential that a weightable and comparable study; a consensus report.

7 Fay A product called SCOR. Our article highlights the need for regulation of these products and associated claims by independent agencies such as the US Food and Drug Administration (FDA). RJRT could help "Clear the Air" by supporting pending FDA legislation, Food and drug manufacturers are not allowed to introduce new products into the market and make claims based solely on their own internal research, and nor should tobacco manufacturers.

In this letter, monthly data for cigarette sales at the state level for the USA are analysed to test for the presence of seasonality and to characterise the phenomenon. The results reveal a seasonal pattern that is significant both in the statistical sense and in magnitude. This includes a drop in the winter months of January and February, and an increase during the summer months of June, July, and August. Because seasonality in sales does not reflect seasonality in production, it must be inferred that the seasonality is driven by wholesale and retail phenomena, including consumption.

The data used in this study are monthly figures for sales of cigarettes by wholesalers to retailers aggregated at the state level between January 1983 and July 2000. Until December 1997, the Tobacco Institute was responsible for their collection. For the period following this, the firm Orzechowski and Walker produced the data.
Two methods were used to examine seasonality. The first was spectral analysis, which identifies cyclical patterns in the data. If a cycle of a particular length is revealed to be important, then a systematic phenomenon underlies the pattern. In the case of seasonality, a cycle of period 12 months would stand out, and the spectrogram was significantly (5% level) different from that produced by a uniform random process (Table 1, column 2).

Using the seasonality analysis, a number of indicators were generated. The p values in Table 1, column 3 correspond to the number of indicators generated. The p values in column 2 were uniformly high or low for any state, for each of the 17 years. The p values in column 3 correspond to the null hypotheses of no stable seasonality in sales. At a significance level of 5%, the null hypothesis of no seasonality is rejected for all states. The state level data contain a prominent 12 month cycle, indicating seasonality. In addition, for 46 out of the 51 locations studied, the seasonal components were selected, and the two with the highest and the two with the lowest range (difference between high and low factors) across the 17 years is about 30%. To put this in perspective, assuming a price elasticity of −0.4, a 30% drop in sales would require a 75% increase in cigarette prices!

Next, to identify the months for which sales were uniformly high or low for any state, for any one year cycle in the data, the two months with the highest and the two with the lowest seasonal components were selected, and the frequency of the appearance of the months in the “high-2” and “low-2” months was computed by state. Columns 5–8 show the most frequently appearing high and low months. For each state, the two months with the highest and the two with the lowest seasonal components were selected, the ratio of the appearance of the months in the “high-2” and “low-2” months was computed by state. Columns 5–8 show the most frequently appearing high and low months. For each state, the two months with the highest and the two with the lowest seasonal components were selected, and the frequency of the appearance of the months in the “high-2” and “low-2” months was computed by state. Columns 5–8 show the most frequently appearing high and low months. For each state, the two months with the highest and the two with the lowest seasonal components were selected, and the frequency of the appearance of the months in the “high-2” and “low-2” months was computed by state. Columns 5–8 show the most frequently appearing high and low months. For each state, the two months with the highest and the two with the lowest seasonal components were selected, and the frequency of the appearance of the months in the “high-2” and “low-2” months was computed by state. Columns 5–8 show the most frequently appearing high and low months. For each state, the two months with the highest and the two with the lowest seasonal components were selected, and the frequency of the appearance of the months in the “high-2” and “low-2” months was computed by state. sales, and June, July, and August, a “high” season.

Possible causes of seasonality include the effect of climate on smoking behaviour (low in cold weather and high in mild weather, especially in view of now widespread indoor smoking restrictions across the USA), the timing of tax changes (December-January or June-July), the timing of the new fiscal year (June-July), the timing of school year (August-June), and the timing of quitting efforts tied to New Year’s resolutions (December-January). In the obvious extension to this research, the determinants of this potentially important statistical phenomenon will be analysed in detail.

The present findings demonstrate that sales of cigarettes in the USA have a strong seasonal component. This has potential implications for the timing of cessation initiatives and other time dependent policies. The phenomenon of seasonality could hold the key to significant advances in tobacco control and in the management of a leading public health problem.

Way-out developments at BATCO

Working in tobacco control, it is easy to get the impression that the tobacco industry is a united front, with all parties carefully avoiding internal divisions that might undermine the greater struggle against the “antis”. However, tobacco industry documents that have been made public as a result of litigation in the USA frequently reveal ruthless competition for market share, as well as intense suspicion about competitors’ activities. This was brought home to us recently when reading a 1977 document on “developments in the scientific field” by Dr Sydney J Green, then British American Tobacco’s (BAT’s) senior scientist for research and development. After several pages of unremarkable reports on industry and external research on low tar cigarettes and smoking and health, Green informed his readers about two “way-out” developments at BAT:

- Way-out development 1: “A way-out development is that of compounds (such as etorphine) which are 10,000 times as effective as analgesics [such as morphine and which are very addictive. It is theoretically possible (if politically unthinkable) to add analytically undetectable quantities of such materials to cigarettes to create brand allegiance. But this thought may suggest the possibility of such compounds occurring naturally.”
- We are grateful to Dr Green for clarifying what “brand allegiance” really means for the tobacco industry.

- Way-out development 2: “Another way-out development, which arises from work done in a quite different area, is that it would now be quite feasible and quite inexpensive to produce an unacceptable off-taste in cigarettes from some factories for a prolonged period without approaching nearer than half to one mile.”

In the same spirit of scientific curiosity which no doubt motivated the BATCO researchers, we would be very interested to know the formula for this substance. On a more serious note, while we were not able to come up with any plausible candidates for a substance that could make way-out development 2 feasible, we are concerned that Green was right about the feasibility of adding etorphine or some other addictive substance to cigarettes.

Green’s report followed an earlier memo from Keith D Kilburn to CI Ayres, expressing
concern about what BATCOC’s competitors might be doing to their “low delivery cigarettes” (that is, low machine measured tar and nicotine yield cigarettes) in order to create brand allegiance. Kilburn proposed that a regular etorphine dose of as little as 0.2 μg per day would be sufficient to create an addictive craving for the source. He also claimed that the required delivery of around 7 μg per cigarette (or around half the delivery of benz[a]pyrene) would be analytically difficult to measure.

Etorphine is a powerful drug with heroin-like effects, which include respiratory failure in the case of overdose. It may be more familiar to veterinarians as “elephant juice” – a veterinary drug with such high potency that a tiny quantity injected from a dart can immobilise an elephant.

The dangers of etorphine to humans have been dramatically demonstrated in accidents during veterinary use, as there have been fatal overdoses to veterinarians attempting to dart large unruly animals. Reputedly, a mere scratch from an etorphine dart has been sufficient in some cases to provide a fatal overdose. As a consequence of these fatalities, veterinarians who are registered to use etorphine must now have an assistant standing by with a dose of an etorphine antagonist in hand.

These observations on the dangers of etorphine underscore Green’s and Kilburn’s essential point: very low concentrations of certain psychoactive substances may be sufficient to produce important effects, including addiction. Fortunately, etorphine has become much more readily detectable in recent years than Green and Kilburn suggested was the case in 1977 because forensic toxicologists have put considerable effort into developing highly sensitive detection methods. However, in a world market with minimal regulation of cigarette additives and limited testing capacity outside the industry’s own laboratories, we should remain concerned about what the tobacco industry might be willing to do in order to create “brand allegiance”.

Interest in nicotine replacement therapy among pregnant smokers

In the UK nicotine replacement therapy (NRT) may now be considered for those pregnant women who cannot otherwise stop smoking.1 However, very little research has been carried out with NRT during pregnancy and the level of interest in using NRT is not known.2 This letter reports the results of a survey to assess the level of interest in using NRT among pregnant smokers.

Across a seven month period pregnant smokers were identified using the patient administration system of a large district general hospital in south west London. Ethical approval was obtained and participants gave verbal consent via the research assistant who identified as smokers at their first antenatal booking visit were telephoned within one week of this visit and invited to take part in the survey. The interview took place during the initial telephone call or during a further call within 48 hours of the initial call. All statistical tests were two-tailed.

Demographic information was obtained from patient records. All the women were asked “Can I just check, are you still smoking at the moment?” (“yes” or “no”). Those still smoking were asked “About how many a day would you say you are smoking at the moment?”, and “Are you thinking of stopping?” (“yes” or “no”). Women stating an interest in receiving help were asked “Some forms of nicotine replacement therapy (NRT) can now be used by pregnant smokers who feel they wouldn’t be able to stop without it. Would you choose to use NRT to help you to stop smoking?” (“yes” or “no”). Of the 207 smokers interviewed (fig 1) the large majority were not in professional managerial occupations (85.0%, 176/207), were white (75.8%, 157/207), and attended their first antenatal booking visit in the hospital (66.7%, 138/207) rather than in the community. The mean (SD) duration of pregnancy was 18.6 (5.6) weeks and the mean (SD) reported number of cigarettes smoked per day was 7.3 (6.1).

Of those women reporting that they were thinking about stopping smoking 44.7% (67/150) expressed an interest in using NRT. Interest in NRT was higher among women who reported smoking more cigarettes per day (analysis of variance (ANOVA); F = 7.6,
Pregnant women registered in hospital \( \text{PAS} = 2776 \)

\[
\text{Never smokers} = 6.00\% \quad (1832/2776) \\
\text{Stopped smoking} = 22.3\% \quad (620/2776) \\
\text{Smokers} = 11.7\% \quad (324/2776)
\]

Refused interview = 0.9\% \quad (3/324) \\
Not contactable = 34.3\% \quad (111/324) \\
Interviewed = 63.8\% \quad (207/324)

\[
\text{Stoped smoking between first antenatal visit and time of interview} = 14.5\% \quad (30/207) \\
\text{Smoking at least one cigarette a day at time of interview} = 85.5\% \quad (177/207)
\]

Thinking about stopping smoking = 84.7\% \quad (150/177) \\
Wanting to stop in the next month = 78% \quad (117/150) \\
Prefering to stop later on = 22% \quad (33/150)

Interested in receiving help with stopping smoking = 63.3\% \quad (95/150)

**Figure 1** Participant flow. PAS, patient administration system.

The distinction between a cigarette and a roll of tobacco wrapped in pharmaceutically flavoured and, as with bidis, consisted of tobacco, cigarillos. They are exclusively manufactured in a variety of foreign and domestic tobaccos, and were therefore eligible for study. Smoking among pregnant women will be the subject of a later report. The US federal tax rate for small cigars was 4 cents per pack of 20, while the rate for cigarettes was 9 cents per pack of 20. While all 50 states impose a tax on cigarettes, only 45 states impose a tax on cigars, which are lower than their cigarette tax. If Voodoo cigarillos are taxed at the rate of cigars, the lower federal and state taxes mean a higher profit margin for the merchant and/or lower prices for consumers.

In addition to tax differences, labelling the Voodoo cigarillo as a cigarette has important legal and financial implications. Since the wrapper of a Voodoo cigarillo contains tobacco, cigarillos are taxed at the same rate as cigarettes. As far as small cigar tax rates are concerned, the US federal law prohibits the sale of cuban cigars, except by businesses that are licensed to deal in tobacco products, “Trinkets & trash: artifacts of the tobacco epidemic”, a collection of current and historic tobacco marketing as well as higher cigarette excise taxes in 1991. This is likely to be because of the high number of Asian women in the local population. Encouragingly, those women who were heavier smokers, and were therefore eligible for NRT, showed most interest in the new product. Around a quarter of the smokers wanting to stop were both eligible for NRT and interested in using NRT. This finding adds support to the argument for conducting further trials of NRT for pregnant smokers. The ultimate test of the acceptability of NRT for these women will be the degree to which NRT is utilised.

**Voodoo cigarillos: bids in disguise?**

As part of its routine monitoring of emerging tobacco products, “Trinkets & trash: artifacts of the tobacco epidemic”, a collection of current and historic tobacco marketing (www.trinketsandtrash.org), recently identified a new tobacco product called Voodoo cigarillos. They are exclusively manufactured in India for the US based Kretek International, a specialty tobacco distributor whose exclusive product line includes Djarum clove cigarettes, Darshan bidis, and Dreams multi-colored and flavoured cocktail cigarettes. The Voodoo cigarillos we obtained were flavoured and, as with bidis, consisted of tobacco flakes wrapped in a leaf tied with a small string. Aside from a slightly larger and more uniform cylindrical shape, Voodoo cigarillos appear to be nearly identical to bidis (fig 1). Only the name on the package would identify it as a cigarette.

US federal regulations define a cigar as any roll of tobacco wrapped in leaf tobacco or in any substance containing tobacco. Voodoo cigarillos appear to be wrapped in tendu leaf, which do not naturally contain tobacco.

So we ask, is this new product a cigarillo or a bidis with new packaging? Federal regulations define a cigarette as any roll of tobacco wrapped in paper or in any substance not containing tobacco. The US Bureau of Alcohol Tobacco and Firearms previously concluded the bidis wrapper did not contain tobacco and, therefore, bids were subject to the federal cigarette tax.

Smoking in children’s picture books

The other day, one of the authors went to a public library with his 3 year old daughter to read some picture books to her. Various picture books, from classic to newly published, were available. Classic books are her favourite. First, she chose a book portraying adventures of a naughty monkey named Curious George (by HA Rey). He came to an industrialised country with a man in a yellow hat. My daughter pointed to a picture of the man holding a pipe between his lips. A smoking scene in a picture book for small children!

The next book she chose depicted an elephant named Babar (by Jean De Brunhoff) that fled from his country to Europe after his mother was killed by men. After coming back to his country with western technologies, he changed elephant society into Western-style society and became a king. Again, the King Babar was holding a pipe.

The third book was depicting a monster named Barbapapa living with François’ family (by Tison and Taylor). He had a mysterious ability to metamorphose into anything he desired. Unfortunately, in this attractive book, François’ father was always holding a pipe. Another supporting character was smoking a cigar. Smoking seems to be a symbol of manhood in these children’s picture books.

My daughter then opened books about Moominvalley (by Tove Jansson) and Tintin’s adventures (by Herge) in which some characters were smoking. Finally, I myself selected a book depicting Father Christmas (by Raymond Briggs). On Christmas Eve, Father Christmas delivers presents to children all over the world. After the labourious job, he took a rest smoking a cigar and a pipe.

Picture books reflect the norms or perceptions of our societies. These classic children’s books were first published in times when smoking was not widely acknowledged as harmful and a smoking male adult was one of the sex stereotypes. In addition, pipe smoking seems acceptable in such picture books compared with cigars or cigarettes which are seldom seen.

Caregivers frequently read picture books aloud to children at home, kindergartens, or daycare centres, which may have a considerable influence on preschool children. Young children receive strong messages from pictures. Seeing adult males smoking in picture books, they may take it as a desirable behaviour.

It would be unacceptable to remove smoking scenes from these classic books or eliminate the books themselves. What we can do is to become aware of the potential influence of these books and take a negative attitude to smoking when we read to children. Fortunately, the man in a yellow hat seems to have quit smoking in the new series of George’s adventures.

Getting them while they’re young in China. Submitted by Professor TH Lam, Hong Kong.
Smoke-filled rooms: a postmortem on the tobacco deal

Smoke and mirrors

Cigarettes are a major cause of premature death. Cigarettes are addictive. Secondhand smoke can be annoying, but is really not enough of a health risk to justify banning smoking in indoor environments. Payments to states in the Master Settlement Agreement were unjustified since cigarettes are self-financing. States actually save money because smokers die young. Lawsuits against the tobacco industry are without merit, since smokers have long known about the health risks. Continuing efforts to warn the public about the health risks of smoking are unwar- ranted since public awareness of these risks are now universal. Filters and low tar technology have made cigarette smoking safer, but more could be done to encourage cigarette manufacturers to produce a less toxic cigarette. The government should focus on giving smokers information about the risks posed by different types of cigarettes, which would foster informed competition in the development of safer cigarettes while at the same time preserving individual choice. Such are the views expressed by Harvard Law Professor W Kip Viscusi in his new book entitled Smoke and mirrors. If cigarette smok- ing hasn’t already caused one to become short of breath, reading this book surely will. Viscu- si’s selective presentation of data on what smoke does can’t be honest if one doesn’t know about all of the risks of smoking, the dangers of secondhand smoke, the benefits of filtered and low tar cigarettes, and ultimately who should be held accountable for the massive toll caused by smoking cigarettes is breathtaking. This book leaves one with the impression that the cigarette industry and not the American public has been the victim in what has been a massive money grab by greedy trial lawyers and the starved state attorneys general. It appears that Dr Viscusi has spent a few too many hours in smoked filled rooms to be able to reasonably separate fact from fiction. How- ever, one fact is crystal clear—Viscusi is not the unbiased observer that the tobacco industry claims. He acknowledges that he has served as an expert witness for the cigarette industry. Thus, his diatribe against plaintiff lawyers, some of whom have risked their own personal fortunes to shed light on the lies and deceit of the cigarette industry, seem misplaced. Viscusi ought to take a look in the mirror.

Reading this book leaves one with the impression that the cigarette industry bears no responsibility for marketing what is admittedly a lethal and addictive product that results in the premature death of one out of every two users. Viscusi dismisses the evi- dence that the cigarette manufacturers knowingly misrepresented the dangers of smoking to the American public on the grounds that smokers knew everything they needed to know about smoking in order to make an informed choice. However, one needs to question whether this assumption is correct. The evidence presented in chapter 7 to support the claim that smokers are fully informed is far from compelling. Viscusi mis- represents polling data showing that the pub- lic has long been aware of medical reports linking smoking and cancer as evidence that smokers were fully informed of health risks. He must surely recognise that having a general awareness that smoking causes cancer does not necessarily translate into a belief that one is more likely to take higher risk of developing cancer. In fact studies conducted by Viscusi himself demonstrate that smokers as a group are less likely to perceive health risks from smoking compared to non-smokers. He also fails to mention the knowl- edge deficits that many smokers have regarding compensatory smoking, the lack of benefits from smoking filtered and low tar cigarettes, and product defects. Viscusi ignores evidence revealing how cigarette manufacturers have designed their cigarettes to induce dependency on nicotine. He also conveniently ignores the data showing that most people begin their smoking careers during their teenage years when there is no real need to keep their teenage years when health concerns about smoking and addiction are not in the realm of consciousness. Viscusi’s choice of the factors involved in youth smoking behaviour represents an exer- cise in selective recall, laying the blame for youth smoking mainly on parents. Hardy a mention is made of the billions of dollars spent annually by cigarette companies to advertise and promote cigarettes. Viscusi also ignores the mountains of internal industry documents that opened the discussion of the importance of the youth market to the econo- mic viability of the cigarette industry. Instead he accepts at face value the industry’s line that they don’t want kids to smoke. Viscusi’s remedy for the youth smoking prob- lem is to get parents do more to keep their kids from smoking and to enact policies to prohibit the sale of unconventional cigarettes like bidis. The discussion of bids is especially odd since he has acknowledged that smoke these products; instead teenagers smoke Marlboro, Newport, and Camel. Thus, while one can hardly argue with Viscusi’s plea for better parenting, his failure to recommend stronger measures to curb how tobacco companies market their cigarettes to attract the attention of youthful smokers makes the sincerity of his recommendations suspect.

Viscusi’s chapter on the health risks associ- ated with secondhand smoke is grossly uninformative. Much of this chapter reads like it was drawn from industry sponsored websites that have been designed to spread misinformation, downplaying the well documented scientific evidence linking secondhand smoke exposure to a wide array of health risk. Remarkably, Viscusi suggests that limits on indoor smoking are unjustified and bad for the economy because such restrictions cause smokers to consume fewer cigarettes, and, therefore, “losses accrue to society in terms of foregone taxes”. Viscusi’s sharp criticism of current public health campaigns to warn the public about the health risks of smoking defies common sense. According to Viscusi, since public awareness of the health risks of smoking are nearly universal, there is no need to keep repeating the same messages. In fact he argues that such efforts are counterproductive because people are likely to form unrealistic risk perceptions about smoking. Such reasoning is illogical. By analogy, if one were to accept Viscu- si’s premise that once the public realises the health risks of smoking there is no need to reinforce health messages, then one would also have to accept the idea that there is no need to spend a dime advertising Marlboro cigarettes since the Marlboro Man is nearly universally recognised. Apparently, cigarette manufacturers don’t accept Viscusi’s logic and nor should the public health community. Declining cigarette consumption in the USA since the 1960s corresponds directly to increased efforts to inform the public of the dangers of tobacco use. Viscusi’s criticism of the current wave of edgy in your face counter-advertising campaigns ignores the evidence that these programmes are actually reducing cigarette consumption. Instead of continuing these effective public health campaigns, Viscusi recommends that the government refor- m its efforts towards giving smokers information about the risks posed by different types of cigarettes in the hope that this would move smokers to use less toxic cigarettes.

Viscusi is correct in noting an important deficiency of the Master Settlement Agree- ment that has made it difficult for new tobacco companies to enter the market, thus dampening competition for the development of potentially safer tobacco products. How- ever, his credibility on this subject is dimi- nished by his acceptance of the view that filtered and low tar cigarettes have actually benefited the public’s health. Convincing evi- dence to demonstrate a measurable public health benefit gained from lowering the machine measured tar yield of cigarettes has proven elusive. Moreover, on a population wide basis, a strong argument can be made that the marketing of lower tar cigarette brands has an adverse impact on the public’s health by convincing a segment of smokers who might have otherwise stopped smoking to maintain their smoking behaviour under the illusion that their disease risk would be reduced by switching to a filtered low tar cigarette.

In summary, Smoked-filled rooms reads more like a legal brief written by a team of tobacco industry lawyers instead of a thoughtful com- mentary on the legal, financial, and social consequences of smoking. As such this book is a must read for plaintiffs’ attorneys, but for the rest of us we should stick with “smoke- free rooms”.

Disclosure
K Michael Cummings is not an unbiased observer of Dr Viscusi’s research and writings. He has served as a paid expert witness on behalf of plaintiffs counsel in several of the same cases in which Dr Viscusi also served as an expert for the cigarette industry. Dr Cummings is currently employed as a senior research scientist and is chairman of the Department of Health Behavior in the Division of Cancer Prevention and Population Sciences at the Roswell Park Cancer Institute in Buffalo, New York, USA. His salary support comes primarily from Roswell Park Cancer Institute and from research funding provided by the National Cancer Institute, the Robert Wood Johnson Foundation, the American Legacy Foundation, and New York State Department of Health. Dr Cummings serves on the medical advisory board for the Flight Attendant Medical Research Institute (FAMRI) and has served on various scientific advisory boards and grant review committees for National Institutes of Health, Centers for Disease Control and Prevention, American Cancer Society, Canadian National Cancer Institute, Robert Wood Johnson Foundation, and state and local health agencies for which he has received honoraria. Dr Cummings has also received honoraria and has accepted hospitality and on a few occasions, travel costs, from pharmaceutical companies making tobacco dependence treatment products.
