Letters intended for publication should be a maximum of 500 words, 10 references, and one table or figure, and should be sent to the editor at the address given on the inside front cover. Those responding to articles or correspondence published in the journal should be received within six weeks of publication.

Listening between the lines: what BAT really thinks of its consumers in the developing world

In an audio recording of the “Structured Creativity Conference” held in Hampshire, UK in June 1984, British American Tobacco (BAT) adds context to the written report of marketing and product applications. Employees are taped brainstorming creative ways to push their product in light of future marketing constraints and social pressure towards a smoke-free society. Project proposals included the following: low sidestream smoke cigarettes, “front end lift” cigarette design to give the smoker more “impact” on the first puff, pleasant smelling sidestream smoke, and anything that might “forget about smoking...GO FOR A QUICKIE. No tar with nic,” and nicotine inhalers. “Forget about smoking and product applications. Adds context to the written report of market creativity conference” held in Hampshire, UK world.

We read the recent article by Slade et al1 with great interest and agree that reasonable regulation focused on the development and appropriate evaluation of potential reduced risk cigarettes is warranted. Furthermore, we agree with Slade et al that the results of our evaluation indicate that Eclipse may offer potential benefits to smokers. However, we disagree with several of the other conclusions drawn by the authors.

The article challenges the merits of Eclipse and questions the fundamental differences between Eclipse and other cigarettes. It is not possible within the context of this letter either to fully describe the scientific data that has been developed to characterise Eclipse or to address many of the criticisms of Eclipse raised in Slade’s article. However, we briefly address pertinent issues below and encourage interested parties to independently evaluate all of the available information.

Slade et al have inaccurately represented the claims that RJ Reynolds Tobacco Company (RJRT) has made regarding Eclipse. No cigarette is without risk, including Eclipse. Our advertising for Eclipse states: “The best choice for smokers who worry about their health is to quit. But Eclipse is the next best choice for those who have decided to continue smoking.” Our advertising also makes it clear that RJRT does not claim that Eclipse is riskless and does not offer a 100% risk-free alternative. Eclipse’s risk reduction potential is limited by the fact that it is a consumer product.

In the absence of any existing regulatory standard, RJRT assessed Eclipse’s risk reduction potential using a four step scientific methodology that included chemical testing and analysis, biological and toxicological testing, human testing, and independent scientific verification. In general, the evaluation strategy utilised was consistent with strategies outlined by the Institute of Medicine Committee that addressed this subject.2 RJRT has conducted an extensive comparative evaluation of Eclipse and has presented this research at scientific meetings in the both the USA and internationally. The results of these and other studies may be reviewed on the Eclipse website (www.eclipsescience.com).

In addition, much of this research has been published in the peer reviewed literature. The weight of the evidence from this research clearly shows that, compared to other cigarettes, Eclipse may present smokers with less risk of cancer, chronic bronchitis, and possibly emphysema. An independent panel of scientific experts reviewed the science and reached conclusions consistent with RJRT’s claims.3

RJRT’s comparative studies were conducted using Kentucky reference cigarettes (K1RF and K1RMF) and leading low “tar” and ultra low “tar” commercial brand styles. Combined, the cigarettes selected for comparison to Eclipse are representative of the vast majority of cigarettes sold in the US market.4 By contrast the entire market segment of the very low yielding ultra low “tar” cigarettes sold by Slade et al as a comparison collectively represent less than 1% of the market. Furthermore, one of the two cigarettes selected as a comparison (Now Box) does not have a measurable US Federal Trade Commission (FTC) “tar” yield.
cigarette smoking condstitutes to the yields of very yielding ultra low “tar” cigarettes (Now Box and Carlson Soft Pack) obtained by machine smoking conditions. RJRT scientists have recently demonstrated Eclipse is significantly more mutagenic on a per mg “tar” basis than either Carlson Soft Pack or Now Box over a wide range of machine smoking conditions. On a per cigarette basis, Eclipse was less mutagenic than Carlton Soft Pack under all machine conditions tested and was less mutagenic than Now Box when evaluated using the machine smoking conditions mandated by both the Massachusetts Department of Health and the Canadian federal government. In addition, Eclipse was significantly less cytotoxic on both a per mg “tar” basis and a per cigarette basis under the same range of machine smoking conditions.

As noted by Slade et al., smokers typically take larger and more frequent puffs than those specified by the US Federal Trade Commission, confirming that cigarettes are smoked differently than their usual brand. Hence, it is essential that a weight-of-the-evidence approach, including studies in smokers, be used to characterise potential differences between Eclipse and other cigarettes. Urine mutagenicity studies conducted in smokers demonstrate that smokers of ultra low “tar”, full flavour low “tar”, and full flavour “tar” cigarettes all experience substantially, statistically significant reductions (p < 0.05) in mutagen exposure when they switch to Eclipse. Furthermore, additional studies conducted in smokers have demonstrated reductions in bronchial inflammation and inflammation of the lower lung when smokers switch to Eclipse. These findings are consistent with reductions in smoker exposure to smoke constituents under actual smoking conditions and support RJRT’s conclusion that Eclipse may reduce the risks of certain smoking related diseases relative to other cigarettes currently on the market.

Author’s reply
Swauger argues that based on the weight of the evidence, Eclipse, compared to other ciga-
rettes, may present smokers with less risk of cancer and other smoking related diseases. He bases this conclusion on “weighing” the scientific research RJ Reynolds Tobacco (RJRT) has conducted on Eclipse. Our study drew the opposite conclusion. Our analysis of the Eclipse research suggests that Eclipse is as toxic or more toxic than a number of conventional cigarette brands.

RJRT claims “there is no cigarette like Eclipse” based on a comparison of the smoke chemistry of Eclipse with a typical ultralight, ultra low “tar,” full flavour low “tar,” and full flavour “tar” cigarettes all experience substantially, statistically significant reductions (p < 0.05) in mutagen exposure when they switch to Eclipse. Furthermore, additional studies conducted in smokers have demonstrated reductions in bronchial inflammation and inflammation of the lower lung when smokers switch to Eclipse. These findings are consistent with reductions in smoker exposure to smoke constituents under actual smoking conditions and support RJRT’s conclusion that Eclipse may reduce the risks of certain smoking related diseases relative to other cigarettes currently on the market.

Seasonal variation in cigarette sales: patterns and implications for tobacco control
Cigarette smoking is the leading public health problem in the USA, contributing to over 400 000 deaths a year. Given its importance, the tobacco control community should be aware of all significant patterns in the consumption of cigarettes. The seasonal variation in cigarette consumption is relevant to efforts aimed at tobacco control. Unfortunately, little attention has been paid to the seasonal nature of smoking. Findings on seasonal patterns may have major implications for the timing of interventions designed to manage the tobacco problem, both in the USA and in other countries.

In this letter, monthly data for cigarette sales at the state level for the USA are analysed to test for the presence of seasonality and to characterise the phenomenon. The results reveal a seasonal pattern that is significant both in the statistical sense and in the magnitude of its effect on sales. This includes a significant drop in the winter months of January and February, and an increase during the summer months of June, July, and August. Because seasonality in sales does not reflect seasonality in production, it must be inferred that the seasonality is driven by wholesale and retail phenomena, including consumption.

The data used in this study are monthly figures for the sales of cigarettes by wholesalers aggregated at the state level between January 1983 and July 2000. Until December 1997, the Tobacco Institute was responsible for their collection. For the period following this, the firm Orzechowski and Walker produced the data.
Two methods were used to examine seasonality. The first was spectral analysis, which identifies cyclical patterns in the data. If a cycle of a particular length is revealed to be important, then a systematic phenomenon identifies a high month for the year in question. In the case of seasonality, a cycle of period 12 months would stand out, and the spectrogram analysis would confirm the seasonal pattern. The second method was Bartlett’s test for seasonality, which is a statistical test for seasonality. The test involves splitting the series into trend, seasonal, and irregular components. Different numbers of indicators were generated. The p values in table 1, column 3 correspond to the null hypothesis of no seasonal components being present. The p values can be interpreted as the probability of observing the data under the assumption of no seasonality. In other words, the higher the p value, the stronger the evidence against the null hypothesis of no seasonality. In percentage terms, the seasonal effect is from that produced by a white noise or uniform random process. The p value for Bartlett’s test is <0.0001 for all states except for Alabama, where the p value is 0.0133. The states with the highest p values are Florida, Idaho, and Indiana, where the p values are close to 0.0001. The states with the lowest p values are Hawaii, Nevada, New Hampshire, New Jersey, and New Mexico, where the p values are close to 0.0001. To put it in perspective, assuming a price elasticity of -0.4, a 30% drop in sales would require a 75% increase in cigarette prices!

Next, to identify the months for which sales were uniformly high or low for any state, any one year cycle in the data, the two months with the highest and the two with the lowest seasonal components were selected, and the frequency of the appearance of the months in the "high-2" and "low-2" months was computed by state. Columns 5–8 show the most frequently appearing high and low months. February appears as a "high-2" month for 42 states, whereas January and February are a "low-2" season for 5 states. The months with extreme seasonal effects (month name and number of times the month is a high-2 or low-2 seasonal factor) are shown in column 2.
sales, and June, July, and August, a “high” season.

Possible causes of seasonality include the effect of climate on smoking behaviour (low in cold weather and high in mild weather, especially in view of now widespread indoor smoking restrictions across the USA), the timing of tax changes (December-January or June-July), the timing of the new fiscal year (June-July), the timing of school year (August-June), and the timing of quitting efforts tied to New Year’s resolutions (December-January). In the obvious extension to this research, the determinants of this potentially important statistical phenomenon will be analysed in detail.

The present findings demonstrate that sales of cigarettes in the USA have a strong seasonal component. This has potential implications for the timing of cessation initiatives and other time dependent policies. The phenomenon of seasonality could hold the key to significant advances in tobacco control and in the management of a leading public health problem.

Way-out developments at BATCO

Working in tobacco control, it is easy to get the impression that the tobacco industry is a united front, with all parties carefully avoiding internal divisions that might undermine the greater struggle against the “antis”. However, tobacco industry documents that have been made public as a result of litigation in the USA frequently reveal ruthless competition for market share, as well as intense suspicion about competitors’ activities. This was brought home to us recently when reading a 1977 document on “developments in the scientific field” by Dr Sydney J Green, then British American Tobacco’s (BAT’s) senior scientist for research and development. After several pages of unremarkable reports on industry and external research on low tar cigarettes and smoking and health, Green informed his readers about two “way-out” developments at BAT:

- Way-out development 1: “A way-out development is that of compounds (such as etorphine) which are 10,000 times as effective as analgesics [such as morphine and which are very addictive. It is theoretically possible (if politically unthinkable) to add analytically undetectable quantities of such materials to cigarettes to create brand allegiance. But this thought may suggest the possibility of such compounds occurring naturally.”

- Way-out development 2: “Another way-out development, which arises from work done in a quite different area, is that it would now be quite feasible and quite inexpensive to produce an unacceptable off-taste in cigarettes from some factories for a prolonged period without approaching nearer than half to one mile.”

In the same spirit of scientific curiosity which no doubt motivated the BATCO researchers, we would be very interested to know the formula for this substance. On a more serious note, while we were not able to come up with any plausible candidates for a substance that could make way-out development 2 feasible, we are concerned that Green was right about the feasibility of adding etorphine or some other addictive substance to cigarettes.

Green’s report followed an earlier memo from Kieth D Kilburn to CI Ayres, expressing...
concern about what BATCO's competitors might be doing to their "low delivery cigarettes" (that is, low machine measured tar and nicotine yield cigarettes) in order to create brand allegiance. Kilburn proposed that a regular etorphine dose of as little as 0.2 µg per dart would be sufficient to create an addictive craving for the source. He also claimed that the required delivery of around 7 ng per cigarette (or around half the delivery of benzo[a]pyrene) would be analytically difficult to measure.

Etorphine is a powerful drug with heroin-like effects, which include respiratory failure in the case of overdose. It may be more familiar to veterinarians as "elephant juice"—a veterinary drug with such high potency that a tiny quantity injected from a dart can immobilise an elephant.

The dangers of etorphine to humans have been dramatically demonstrated in accidents during veterinary use, as there have been fatal overdoses to veterinarians attempting to dart large unripe animals. Reputedly, a mere scratch from an etorphine dart has been sufficient in some cases to produce a fatal overdose. As a consequence of these fatalities, veterinarians who are registered to use etorphine must now have an assistant standing by with a dose of an etorphine antagonist in hand.

These observations on the dangers of etorphine underscore Green's and Kilburn's essential point: very low concentrations of certain psychoactive substances may be sufficient to produce important effects, including addiction. Fortunately, etorphine has become much more readily detectable in recent years than Green and Kilburn suggested was the case. Hence forensic toxicologists have put considerable effort into developing highly sensitive detection methods. However, in a world market with minimal regulation of cigarette additives and limited testing capacity outside the industry's own laboratories, we should remain concerned about what the tobacco industry might be willing to do in order to create "brand allegiance".

How to critique consultancy reports?

The recent proposals for smoke-free legislation in many countries have spawned a multitude of studies which attempt to predict the financial impact of such legislation. As described by Scollon et al in this issue of Tobacco Control, many of these studies fail to achieve basic quality standards and this is more likely when the tobacco industry funds the study. However, findings from such flawed studies can influence policy makers and it is essential that public health advocates have strategies to counter their impact.

In Hong Kong in 2001, the government proposed to make all workplaces, including catering venues, smoke-free. 1 A consultancy report for the catering industry, funded by the tobacco industry, was published shortly after and concluded that the legislation would cause catering industry revenues to drop by 10.6% leading to job losses. This report was based on a survey of customers to catering venues, self reported spend on eating and drinking out, and self predicted changes in the event that catering venues were made smoke-free. Since the methods used were not made clear in the report, we had to attempt to validate or refute the report mainly by an assessment of its findings. We found the following questions useful:

1 Was the sample used for the consult- ant's survey representative of the population being studied (customers of catering venues)?
2 Since we could not determine if sample selec- tion was done properly, we had to look at sample characteristics. The prevalence of smokers was much higher than in other survey data indicating a bias in the sample.
3 Did the new data, when extrapolated/aggregated, agree with other standard data sources—for example, govern- ment statistics? Much of the basic data collected by the consultants was not disclosed in their report but in their case, they had to present some—for example, average weekly spends in the different types of cater- ing venues. From these data we could estimate (a) expected weekly revenue in the catering industry, (b) approximate market shares for the different types of venue, and (c) weekly spend on eating out per household if the consultant's data were valid. Each of these estimates was quite implausible when com- pared with data from the census and other government sources.
4 Could the consultant's findings be reproduced to shed light on the methods used? Using a new set of data based on random sampling, we tried to recreate the consultant's findings by deliberately introducing biases and incorrect aggregations which we suspected were present in the consultant's methods. In this way we were able to produce an almost identical set of results from the new data. On the other hand, when we analysed the new data in an appropriate fashion, we predicted a rise of 5% rather than a drop of nearly 11% in catering revenues.
5 The best means of influencing policy on smoke-free venues is to use objective outcome measures and data collected both before and after the intervention, as recom- mended by Siegel. If the consultant's data are valid, their study would have failed Siegel's quality criteria. However, since much of the lobbying against smoke-free leg- islation is done before such policies are put in place, local objective, before and after data are inevitably not available. In our case, present- ing our rebuttal of the consultant's findings along with the evidence accumulated from overseas studies that smoke-free policies do not harm catering industry revenues, greatly reduced the harm that the consultant's report could have done to the proposed legislative process. Our approach may be helpful to policy makers faced with a similar situation in their own locality.
p = 0.006; mean (SD) cigarettes a day: interested in NRT (n = 67) = 9.5 (6.3), not interested in NRT (n = 83) = 7.1 (4.2). Following current licensing regulations, 39.3% (59/150) of the women wanting to stop smoking reported smoking sufficient cigarettes per day (>10) to be considered eligible for NRT. Interest in using NRT was significantly higher for those smoking at least 10 cigarettes a day (χ²; y = 5.0, p = 0.03; 10 or more cigarettes a day: interested in NRT = 55.9% (33/59), less than 10 cigarettes a day: interested in NRT = 37.4% (34/91)). Overall, 22% (33/150) of those reporting wanting to stop smoking were both interested in NRT and eligible for NRT.

The results indicate a high level of interest in stopping smoking among pregnant women still smoking following their first antenatal booking and a moderate level of interest in using NRT. Fewer women were recorded as smokers at their first antenatal visit than would be expected from national data. This is likely to be because of the high number of Asian women in the local population. Encouragingly, those women who were heavier smokers, and were therefore eligible for NRT, showed most interest in NRT. Around a quarter of the smokers wanting to stop were both eligible for NRT and interested in using NRT. These findings add support to the argument for conducting further trials of NRT for pregnant smokers. The ultimate test of the acceptability of NRT for these women will be the degree to which NRT is utilised.

Voodoo cigarillos: bids in disguise?

As part of its routine monitoring of emerging tobacco products, “Trinkets & trash: artifacts of the tobacco epidemic”, a collection of current and historic tobacco marketing (www.trinketsandtrash.org), recently identified a new tobacco product called Voodoo cigarillos. They are exclusively manufactured in India for the US based Kretek International, a specialty tobacco distributor whose exclusive product line includes Djarmo clove cigarettes, Darshan bids, and Dreams multi-coloured and flavoured cocktail cigarettes.1

The Voodoo cigarillos we obtained were flavoured and, as with bids, consisted of tobacco flakes wrapped in a leaf tied with a small string. Aside from a slightly larger and more uniform cylindrical shape. Voodoo cigarillos appear to be nearly identical to bids (fig 1). Only the name on the package would identify it as a cigar, as with tobacco wrapped in paper or in any substance not containing tobacco. The US Bureau of Alcohol, Tobacco and Firearms previously concluded the bidi wrapper did not contain tobacco and, therefore, bids were subject to the federal cigarette tax.2

So we ask, is this new product a cigarette or a bidi with new packaging? Federal regulations define a bidi as any roll of tobacco wrapped in paper or containing tobacco. The US Bureau of Alcohol, Tobacco and Firearms previously concluded the bidi wrapper did not contain tobacco and, therefore, bids were subject to the federal cigarette tax.2

The distinction between a cigarillo and a cigarette has important legal and financial implications. Since the wrapper of a cigarillo contains tobacco, cigarillos are taxed at the same rate as regular cigarettes. In 2002, the US federal tax rate for small cigars was 4 cents per pack of 20, while the rate for cigarettes was 39 cents per pack of 20.3 While all 50 states impose a tax on cigarettes, only 45 states impose a tax on cigars,4 which are lower than their cigarette tax.5 If Voodoo cigarillos are taxed at the rate of cigars, the lower federal and state taxes mean a higher profit margin for the merchant and/or lower prices for consumers.

In addition to tax differences, labelling the Voodoo product as a cigar has important consequences for their regulation. Several states have expanded their definition of tobacco products to include bids, making sales to minors illegal. Illinois, Vermont, and West Virginia banned the sale of bids completely.6 More recently, California passed a bill prohibiting the sale, distribution or importation of bids except by businesses that prohibit minors, such as bars and casinos.7 Also, federal legislation to halt the importation of bids into the USA was introduced in 2002.8 By being sold as a cigar product, Voodoo cigarillos would get around the ban on bidi sales in some states.

This new product emerges at a time when bidi sales are vulnerable to increased regulation at the state, and possibly the federal level, as well as higher cigarette excise taxes in 19 states in 2002.9 The Voodoo cigarillo may be a clever way for the tobacco industry to circumvent the regulations and restrictions imposed on bids. Voodoo cigarillos should be reliably tested to determine if manufacturers and vendors are in compliance with federal and state laws.

Smoking in children’s picture books

The other day, one of the authors went to a public library with his 3 year old daughter to read some picture books to her. Various picture books, from classic to newly published, were available. Classic books are her favourite. First, she chose a book portraying adventures of a naughty monkey named Curious George (by HA Rey). He came to an industrialised country with a man in a yellow hat. My daughter pointed to a picture of the man holding a pipe between his lips. A smoking scene in a picture book for small children!

The next book she chose depicted an elephant named Babar (by Jean De Brunhoff) that fled from his country to Europe after his mother was killed by men. After coming back to his country with western technologies, he changed elephant society into Western-style society and became a king. Again, the King Babar was holding a pipe.

The third book was depicting a monster named Barbapapa living with François’ family (by Tison and Taylor). He had a mysterious ability to metamorphose into anything he desired. Unfortunately, in this attractive book, François’ father was always holding a pipe. Another supporting character was smoking a cigar. Smoking seems to be a symbol of manhood in these children’s picture books.

My daughter then opened books about Moominvalley (by Tove Jansson) and Tintin’s adventures (by Herge) in which some characters were smoking. Finally, I myself selected a book depicting Father Christmas (by Raymond Briggs). On Christmas Eve, Father Christmas delivered presents to children all over the world. After the labourious job, he took a rest smoking a cigar and a pipe.

Picture books reflect the norms or perceptions of our societies. These classic children’s books were first published in times when smoking was not widely acknowledged as harmful and a smoking male adult was one of the sex stereotypes. In addition, pipe smoking seems acceptable in such picture books compared with cigars or cigarettes which are seldom seen.

Caregivers frequently read picture books aloud to children at home, kindergartens, or daycare centres, which may have a considerable influence on preschool children. Young children receive strong messages from pictures. Seeing adult males smoking in picture books, they may take it as a desirable behaviour.

It would be unacceptable to remove smoking scenes from these classic books or eliminate the books themselves. What we can do is to become aware of the potential influence of these books and take a negative attitude to smoking when we read to children. Fortunately, the man in a yellow hat seems to have quit smoking in the new series of George’s adventures.

Getting them while they’re young in China. Submitted by Professor TH Lam, Hong Kong.
**BOOK REVIEW**

**Smoke-filled rooms: a postmortem on the tobacco deal**

**Smoke and mirrors**

Cigarettes are a major cause of premature death. Cigarettes are addictive. Secondhand smoke can be annoying, but is really not enough of a health risk to justify banning smoking in indoor environments. Payments to states in the Master Settlement Agreement were unjustified since cigarettes are self financing. States actually save money because smokers die young. Lawsuits against the tobacco industry are without merit, since smokers have long known about the health risks. Continuing efforts to warn the public about the health risks of smoking are unwarrented since public awareness of these risks are now universal. Filters and low tar technology have made cigarette smoking safer, but may be confusing. soak is not enough to encourage cigarette manufacturers to produce a less toxic cigarette. The government should focus on giving smokers information about the risks posed by different types of cigarettes, which would foster a market in the competition in the development of safer cigarettes while at the same time preserving individual choice.

Such are the views expressed by Harvard Law Professor W Kip Viscusi in his new book entitled Law Professor W Kip Viscusi in his new book entitled *Smoke-filled rooms: a postmortem on the tobacco deal*. Smokers have long known about the health risks. Continuing efforts to warn the public about the health risks of smoking are not in the realm of consciousness. Viscusi’s chapter on the factors involved in making informed is far from compelling. Viscusi misrepresent the dangers of smoking hasn't already caused one to become short of breath, reading this book surely will. Viscusi’s selective presentation of data on what constitutes a strong or weak cigarette makes it difficult to accept at face value the industry’s line that they don’t want kids to smoke. Viscusi’s remedy for the youth smoking problem is to get parents to do more to keep their kids from smoking and to enact policies to prohibit the sale of unconventional cigarettes like bics. The discussion of bids is especially odd since Viscusi claims that the tobacco industry is interested in expanding the market for lower tar cigarettes, and ultimately who should be held accountable for the massive death toll caused by smoking cigarettes is breathtaking. This book leaves one with the impression that the cigarette industry and not the American public has been the victim in what has been a massive money grab by greedy trial lawyers and the unbiased observer of the tobacco industry. He acknowledges that he has served as an expert witness for the cigarette industry. Thus, his diatribe against plaintiff lawyers, some of whom have risked their own personal fortunes to shed light on the lies and deceit of the cigarette industry, seems misplaced. Viscusi ought to take a look in the mirror.

Reading this book leaves one with the impression that the cigarette industry bears no responsibility for marketing what is admittedly a lethal and addictive product that results in the premature death of one out of every two users. Viscusi dismisses the evidence that the cigarette manufacturers knowingly misrepresented the dangers of smoking to the American public on the grounds that smokers knew everything they needed to know about smoking in order to make an informed choice. However, one needs to question whether this assumption is correct. The evidence presented in chapter 7 to support the claim that smokers are fully informed is far from compelling. Viscusi misrepresents polling data showing that the public has long been aware of medical reports linking smoking to cancer and evidence that smokers were fully informed of health risks. He must surely recognise that having a general awareness that smoking causes cancer does not necessarily translate into a belief that one is personally at a higher risk of developing cancer. In fact studies conducted by Viscusi himself demonstrate that smokers as a group are less likely to perceive health risks from smoking compared to non-smokers. He also fails to mention the knowledge deficits that many smokers have regarding compensatory smoking, the lack of benefits from smoking filtered and low tar cigarettes, and the billions of dollars spent annually by cigarette companies to advertise and promote cigarettes. Viscusi also ignores the mountains of internal industry documents that opened the door of years of clever marketing to the economic viability of the cigarette industry. Instead he accepts at face value the industry’s line that they don’t want kids to smoke. Viscusi’s remedy for the youth smoking problem is to get parents to do more to keep their kids from smoking and to enact policies to prohibit the sale of unconventional cigarettes like bics. The discussion of bids is especially odd since Viscusi claims that the tobacco industry is interested in expanding the market for lower tar cigarettes, and ultimately who should be held accountable for the massive death toll caused by smoking cigarettes is breathtaking. This book leaves one with the impression that the cigarette industry and not the American public has been the victim in what has been a massive money grab by greedy trial lawyers and the unbiased observer of the tobacco industry. He acknowledges that he has served as an expert witness for the cigarette industry. Thus, his diatribe against plaintiff lawyers, some of whom have risked their own personal fortunes to shed light on the lies and deceit of the cigarette industry, seems misplaced. Viscusi ought to take a look in the mirror.

Thus, his diatribe against plaintiff lawyers, some of whom have risked their own personal fortunes to shed light on the lies and deceit of the cigarette industry, seems misplaced. Viscusi ought to take a look in the mirror.

Reading this book leaves one with the impression that the cigarette industry bears no responsibility for marketing what is admittedly a lethal and addictive product that results in the premature death of one out of every two users. Viscusi dismisses the evidence that the cigarette manufacturers knowingly misrepresented the dangers of smoking to the American public on the grounds that smokers knew everything they needed to know about smoking in order to make an informed choice. However, one needs to question whether this assumption is correct. The evidence presented in chapter 7 to support the claim that smokers are fully informed is far from compelling. Viscusi misrepresents polling data showing that the public
The lighter side
