The impact of the cigarette market opening in Taiwan

C P Wen, T Y Cheng, M P Eriksen, S P Tsai, C C Hsu

Objective: To assess the effect of the opening of the Taiwanese cigarette market on cigarette consumption, changes in market share, and the effects on tobacco control efforts.

Methods: With the use of key word “Taiwan”, the Legacy Tobacco Documents Library of the University of California, San Francisco, was searched for internal documents related to smuggling activities, promotion of light cigarettes, and market share analyses in Taiwan. Age adjusted smoking rates and cigarette and betel quid consumption before and after market opening were compared.

Results: By 2000, the market share of imported cigarettes increased from less than 2% in 1986 to nearly 50%, and per capita cigarette consumption increased 15% following market opening. Because of the sharp increase in smuggling, with contraband cigarettes being as popular as legal imports, and the rapid proliferation of retail outlets, such as betel quid stalls, the market penetration by foreign tobacco companies was greater in Taiwan than among the other Super 301 Asian countries. Aggressive cigarette marketing strategies were associated with a 6% increase in adult male smoking prevalence, and with a 13% increase in the youth rate, within three years after market opening. The market opening also had an incidental effect on increasing the popularity of betel quid. Betel quid chewing has since become a major public health problem in Taiwan.

Conclusion: The opening of the cigarette market in 1987 had a long lasting impact on Taiwan. It increased smoking prevalence and the market has become dominated by foreign companies. The seriousness of smuggling and its associated loss of revenue by the government, the extent of increased youth smoking and its associated future health care costs, and the increased use of betel quid and the associated doubling of oral cancer mortality rates each pose significant problems to Taiwan. However, the market opening galvanised anti-smoking sentiment and forced the government to initiate and intensify a series of tobacco control efforts.

For 50 years between 1895 and 1945, Taiwan was under Japanese colonial rule, and the government run Taiwan Tobacco and Wine Monopoly Bureau (the Monopoly Bureau) produced relatively few cigarettes until the early 1940s when it reached 0.5 million cases (10 000 cigarettes/case) a year. The second world war soon interrupted this level of production when the Chinese took over the Monopoly Bureau. Production returned to pre-war levels by 1950, and tripled the number of cigarettes produced over the next 30 years, from 1 million cases in 1955 to 3 million cases in 1985, outpacing the increase in population. The contribution of cigarettes to the total national revenue was 10% in 1970, but decreased steadily afterwards, to 8% in 1975, 5% in 1980, 2% in 1990, and 1% in 2000, not because of reducing tobacco consumption, but mainly because of the expanding tax base from personal income and general tax during periods of rapid economic development.

Taiwan grows relatively little tobacco. Even when it peaked in 1985, production was only 25 000 000 kg, covering 10 000 hectares (24 700 acres) with up to 90% of tobacco used in cigarette production coming from imported tobacco leaf. The Monopoly Bureau contracted with some 10 000 licensed retail outlets to market cigarettes in the 1970s and 1980s. Other than these authorised outlets, no other retailers could legally sell tobacco. Before the 1987 market opening, foreign cigarettes constituted less than 2% of overall market share.

The opening of the cigarette market in 1987 marked a turning point for the monopoly system. Under the threat of retaliatory sanctions by the US government, the Taiwan government, like its counterparts in Japan, South Korea, and Thailand, was forced to give up its century long monopoly control of the cigarette market.

METHODS

Age adjusted smoking rates and cigarette and betel quid consumption before and after market opening were compared. These data were obtained from surveys conducted by the Taiwan Monopoly Bureau, the Taiwan National Health Survey; POS, point of sale.

Abbreviations: JT, Japan Tobacco Inc; NHIS, National Health Interview Survey; POS, point of sale.
2002.1 Although this appeared to be a major change, the Bureau responded by quickly increasing the production of the majority of leading foreign brands were “light” and were continued smoking and heavier smoking.22 Virginia Slims,24 25 mild and light cigarettes almost certainly contributed to domestic production was light cigarettes.1 Recognising that cigarettes before 1988, and, in that first year, only 9% of cigarettes,28 as smokers tried to reduce the health hazards of smoking, and believed that smoking light cigarettes would do so.22 The Monopoly Bureau did not produce any light cigarettes to be advertised and promoted.3 On the surface, the use of “Taiwan” as the key word, Legacy Tobacco Documents Library of the University of California, San Francisco, was searched for industry internal documents related to smuggling activities, promotion of light cigarettes, and market share analyses in Taiwan. A detailed description of this search has been presented elsewhere.4

RESULTS

Aggressive strategies for advertisement and promotion

As there were reports that limited cigarette advertising existed among some countries with monopoly system,14 the advertising under the monopoly system in Taiwan, if any, had been largely informational.15 As a result of the pressure from the USA, Taiwan signed an agreement allowing foreign cigarettes to be advertised and promoted.3 On the surface, the concessions seemed quite limited, allowing up to 120 advertising insertions per company in magazines within a year, and restricting cigarette promotions to remain inside retail outlets. However, aggressive strategies such as the expanded use of unlicensed betel quid stalls in selling cigarettes,5 youth targeting, and brand stretching advertising,6 were employed and have achieved market share expansion by foreign tobacco companies well beyond that which would have been expected via traditional marketing. For example, within the five years 1995–2000, the total expenditures on all forms of advertising by foreign tobacco companies increased more than fivefold (451%).4 Much of the expenditure was spent on brand stretching on the Mild Seven (Japan) and Davidoff (Germany) brands in television advertising. Such a practice is controversial, since no tobacco advertising on television is legally allowed. Limited by the number of licensed establishments, foreign tobacco companies sought new retail outlets and made use of tens of thousands of “unlicensed” POS locations. With additional businesses selling imported cigarettes, roadside stalls selling betel quid substantially boosted their fledgling betel quid business.26 To target the young and new smokers, foreign cigarette companies clearly stated their strategic plans and focused their business priorities on this relatively small but important market.17–21

Promotion of light and mild cigarettes

Light cigarettes were introduced to Taiwan at the time of the market opening. Foreign tobacco companies disproportionately promoted mild and light cigarettes, which not only attracted new and young smokers, but also intercepted smokers who might have otherwise quit.22 23 The popularity of mild and light cigarettes almost certainly contributed to continued smoking and heavier smoking.22 Virginia Slims,24 25 Mild Seven,27 and the Joe Camel Smooth campaign28 all emphasised the mild and smooth nature of light cigarettes, particularly catering to young and new smokers, but also to potential quitters.27 Anti-smoking campaigns by the government may have contributed to the popularity of light cigarettes,6 as smokers tried to reduce the health hazards of smoking, and believed that smoking light cigarettes would do so.22 The Monopoly Bureau did not produce any light cigarettes before 1988, and, in that first year, only 9% of domestic production was light cigarettes.1 Recognising that the majority of leading foreign brands were “light” and were capturing an increasing share of the market, the Monopoly Bureau responded by quickly increasing the production of light cigarettes to 30% of its sales by 1992, reaching 100% by 2002.1 Although this appeared to be a major change, the purportedly light cigarettes produced by the Monopoly Bureau, when tested by a foreign competitor, were not ventilated29 and had tar concentrations measured at around 18–24 mg,30 31 which were higher than the commonly used machine yield value of 15 mg or lower for light cigarettes.23 In the absence of technology to produce cigarettes with ventilation, the Monopoly Bureau had great difficulty in keeping the tar values low. As a result, the Monopoly Bureau, unable to compete in the light market, catered to older smokers and was viewed by smokers in Taiwan as the producer of strong flavoured regular cigarettes.21 The market opening associated light cigarettes with imported cigarettes and placed the Monopoly Bureau at a disadvantage. As more and more smokers switched to “light” cigarettes, the strong flavoured domestic cigarettes lost appeal.

Cigarette smuggling

Although contraband cigarettes have always existed in Taiwan,1 they played a small role before the opening, partly because cigarettes were only available through licensed establishments,3 and smuggled products had no convenient retail outlets. The licensed establishments faced too large a risk to sell contraband cigarettes openly. This changed after the market opened. Foreign tobacco companies sought and established a network of retail outlets to sell their products, such as convenience stores and betel quid stalls. When betel quid stalls started selling both legal and contraband cigarettes, their business increased and more stalls were established.2 The confiscated quantity of smuggled cigarettes in 1990 was officially reported as roughly 10-fold the amount in 1986 (table 1).1 In a nationwide survey, 8% of male adult smokers reported a preference for imported cigarettes in 1986,5 reflecting the potentially small share of the contraband market. Once the market opened, smuggled cigarettes grew rapidly as smoker’s preference for imports nearly tripled in 1987.21 According to industry documents, smuggled cigarettes equalled or even exceeded those legally imported ones and accounted for 15% (12%–18%) of the entire market by first half of 1990s (table 1).

Increased consumption of betel quid

Cigarettes were legally available only at licensed establishments in Taiwan, both before and after the market opened.1 The licensure authorisation came from the Monopoly Bureau and enforcement was simple when cigarettes made only by the Bureau were sold. The need for retail outlets increased almost overnight as a result of the 1987 market opening, and foreign tobacco companies expanded to the existing betel quid street vendors to sell cigarettes.13 US cigarette firms largely ignored permit requirements for these retail outlets and governmental authorities protested such violations to no
Changes in market share

As feared by the Monopoly Bureau, opening of the cigarette market in Taiwan dramatically increased the market share of imported cigarettes. In six years, imports increased from 2% of the cigarette market in 1986 to 28% in 1992, not counting smuggled cigarettes, and to 43% if smuggled cigarettes were included. By 2000, nearly half (48%) of all legal cigarettes came from outside of Taiwan (table 2). Compared to other Asian countries that opened their cigarette markets to imported cigarettes, Taiwan experienced the largest market penetration by foreign cigarette companies. The market share of foreign tobacco of the four Super 301 countries—Japan, Taiwan, South Korea, and Thailand—in 2000 was 24%, 48%, 9%, and 18%, respectively (table 2). If Taiwan had the same market penetration as in South Korea, nearly 40% of the entire cigarette expenditure, or US$2 billion a year, would not have been spent on imported cigarettes.

While the overall imported cigarette market share has dramatically increased, the US proportion of the market has gradually declined. This observation is somewhat ironic given that the market opening effort was entirely the result of pressure exerted by the US government. In 1987, at least 75% of imported cigarettes were from the USA, which reduced to 21% in 1995 and 10% in 2000. The USA is now ranked fourth in imported cigarette market share, after Japan, UK, and Germany. A major reason for US cigarettes retreating in the 1990s in Taiwan was the documented, aggressive smuggling by Japan Tobacco Inc (JTI) in the early 1990s.7 The US tobacco companies, including RJ Reynolds and British American Tobacco, showed 90% of all smuggled cigarettes to Taiwan in the first half of 1990 were from JTI. Smuggled JTI “Mild Seven” cigarettes accounted for nearly 10–20 times the Japanese market share.7 The US tobacco companies protested without avail against governmental action in not destroying those confiscated Japanese cigarettes.36
Smoking rates
Male smoking prevalence in those aged 35 and above was over 7% in early 1960s, and remained at that level into the 1970s (fig 2). The rates started to decline in the late 1970s, and the decline accelerated in the 1980s. When the market opened, the previous declining trend was reversed and the smoking rate increased by 6% within three years (1986–1990). Per capita consumption also increased, from 1604 cigarettes/year in 1986 to 1717 cigarettes/year in 1990, an increase of 7%, and to 1840 cigarettes/year in 2000, an increase of 15% compared to 1986 levels. Female smoking prevalence was substantially lower than the male rate, around 8–12% in the 1960s and 1970s, and gradually declined afterwards (fig 3). Before market opening, female smoking prevalence was 3.6% in 1986. Upon opening, the rate increased to 5.1% by 1990, an increase of 42%. Smoking rates among younger men, aged 18–25, increased from 20% in early 1960s to 35% in the late 1970s (fig 2). This increase slowed in the 1980s until the market opened in 1987. Following the market opening, there was an increase in smoking prevalence, with the increase being nearly double that seen among older adults (37.3% in 1986 to 42.0% in 1990, an increase of 12.8%). Among younger women, the rise after the market opened was even more pronounced, albeit smaller in absolute number, increasing from 0.9% in 1986 to 1.4% in 1990, an increase of 56% (fig 3).

ANTI-SMOKING INITIATIVES BY THE TAIWAN GOVERNMENT
After the cigarette market was opened, the Taiwan government was stimulated to initiate many anti-smoking programmes, responding to the publicity of the “tobacco war”. These activities included school-based programmes in 1987 and 1991, collaboration with an anti-smoking non-governmental organisation on public campaigns for tobacco control, discontinuation of the four decade long rationing system of supplying free cigarettes to military personnel in 1991, a ban on smoking in public places such as governmental offices, classrooms or theatres and on public transport in 1995, and legal initiatives culminating in the enactment of the 1997 Tobacco Hazards Control Act that has comprehensive tobacco control policies. In 2002, an increase in cigarette taxes was levied on the low priced Taiwan cigarettes (14% tax on an averaged price of US$1/pack), with a portion of the increased revenue dedicated to tobacco control programmes, amounting to 30 times the previous annual budget for tobacco control.

DISCUSSION
The opening of the cigarette market in 1987 has had a profound and sustained impact on Taiwan. The previously declining smoking rates reversed. There was a dramatic shift in market share toward purportedly lower tar, imported cigarettes. Smuggling increased and government lost revenue. Youth smoking increased, with an expected increase in future health care costs. Betel quid consumption has increased dramatically and the oral cancer mortality rate has doubled. Together, these factors have had an extremely negative effect on the public health in Taiwan. The findings of this study can serve as a valuable lesson to those countries, such as China and India, contemplating opening their cigarette market to the multinational tobacco companies. It would be of interest to undertake a further study on measures adopted by other super 301 countries on the extent of their success in resisting the penetration by foreign tobacco companies.

The four Super 301 countries were adversely affected by the opening of the cigarette market, with an average of 10% increase in per capita consumption than would otherwise have occurred without market opening. However, among these countries, Taiwan had the largest and most rapid increase in the market share of imported cigarettes. Aside from minor details, all four countries had similar agreements allowing tobacco companies to engage in various advertising and promotional activities, and yet the market share grew most in Taiwan. Reasons for this are complex, but the use of betel quid stalls to serve as cigarette retail outlets and smuggling caused by the closed market to JTI have played an important role.

The sudden and sharp increase in betel quid consumption immediately after cigarette market opening was totally unanticipated and has brought serious health consequences to Taiwan. The sharp increase in oral cancer mortality is a tragic effect of the market opening. The relatively short lag time between the time of consumption and the oral cancer deaths, roughly between 3–7 years (fig 1), has made the tragedy more visible. The oral cancer mortality rate in Taiwan is similar to that of the USA or Japan in the early 1980s, but the male rate in Taiwan has become five times higher in 2001, nearly the highest in the world. Because few women chew betel quid, their oral cancer rate remains as low as in the USA or Japan. The fact that market opening was associated with a sharp increase in smuggling is surprising, but the following factors may have facilitated such a phenomenon in Taiwan: sudden increase in retail outlets, increasing demand for foreign cigarettes, and more difficulty in identifying the contraband cigarettes by the government after the market opened. Taiwan resisted the market opening during negotiations with the USA, but was reported to be mostly for financial concerns. While the Monopoly Bureau had lost some revenue due to decreased market share, this loss was offset by the government collecting additional tariffs on the increased volume of imported cigarettes. As cigarette consumption increased after the market opened, with higher
tariffs collected from imported cigarettes, the total revenue by the government has continued to increase. Given such increased revenue in retrospect, the government would have had relatively little incentive to resist market opening based on financial considerations. There were others who benefited from market opening: the retail outlets, notably the convenience stores and the betel quid business, the media with their cigarette advertising and promotional revenues, the lobbying groups for the foreign tobacco companies, the intermediaries involved in the smuggling chains, and the foreign tobacco companies. The losers were quite obvious: the young smokers and the young betel quid chewers, and all citizens, who are expected to pay for the current and future medical care expenditures of smokers and their families.

The market opening galvanised anti-smoking sentiment and stimulated the government to initiate and intensify a series of tobacco control efforts. Although a decade of tobacco control effort has contributed to making smoking increasingly socially unacceptable, these public health efforts have not reversed the harmful effects of market opening.
