JUUL and other stealth vapourisers: hiding the habit from parents and teachers

Divya Ramamurthi, Cindy Chau, Robert K Jackler

ABSTRACT
Background  Some consumers wish to use vapour devices discreetly so that family members, teachers and coworkers do not recognise their use of nicotine or tetrahydrocannabinol (THC) laden vapour.

Methods  Stealthy vapour devices, as well as low-odour and low-vapour e-juices, were identified via a comprehensive online search between March and June 2018.

Results  As evidence of their popularity, a search for ‘stealth vaping’ on YouTube found 18 200 videos. A variety of cleverly designed vapour devices disguised as USB sticks, pens, remote controls, car fobs, smart phones, sweatshirt drawstrings and even asthma inhalers are on the market. JUUL, which resembles a USB stick, is the archetype of these devices and is especially popular among youth. A search of ‘JUUL’ on YouTube yielded 148 000 videos with 57 videos having >100 000 views. Searches on ‘JUUL at school’ (15 500), ‘JUUL in class’ (6840), ‘hiding JUUL in school’ (2030) and ‘JUUL in school bathroom’ (1040) illustrate the product’s popularity among students. Some e-juices promote themselves as having low visibility plumes while others profess to be of subtle odour to avoid detection. Numerous techniques have been described to hide the exhaled vapour plume such as by swallowing it or blowing it into one’s clothing or into a backpack.

Conclusions  The vaping industry has demonstrated much ingenuity in devising discreet vapourisers and de-emphasising exhaled vapour plumes and their aroma. The US market for vaping devices with stealthy characteristics is anything but inconspicuous, with JUUL alone accounting for 70.5% of sales (July 2018).

INTRODUCTION
Teens have long sought to hide their tobacco and marijuana use from disapproving parents and teachers. In the past, this meant secreting cigarettes and joints in out-of-the-way places and smoking surreptitiously out of sight. Recently, a new means of covert nicotine and marijuana use is rapidly gaining popularity. A proliferation of stealth vapourisers, devices which resemble ordinary items which may not draw attention from adults, are increasingly popular. A search for ‘stealth vaping’ on YouTube found 18 200 videos (June 2018). This family of devices may be left on a teen’s bedside table and not be recognised for what it is by a parent. This is typified by the meteoric rise of JUUL, an e-cigarette which closely resembles a USB stick.1–4 JUUL is increasingly popular among high school students who often use it during school in bathrooms, staircases or even in classes.5

The purpose of this study is to describe the diversity of stealth vapourisers, devices disguised to resemble something other than what they are, to enable inconspicuous vaping. This includes vapourisers of nicotine and tetrahydrocannabinol (the psychoactive constituent of marijuana) contained in e-liquid, oil, concentrates and dry marijuana flower. In addition, we explore vaping liquids marketed as generating a less conspicuous exhaled vapour and methods used by consumers to conceal the exhaled vapour plume.

METHODS
Identification of stealth devices and e-juices was conducted by online searches (Google) between March and June 2018. Brand websites and social media postings, consumer reviews of vaping products, media articles and YouTube videos were the major sources. Search terms to identify brands include the following: a combination of vapour brands (eg, JUUL), vaping terms (eg, e-cigarette, e-juice, e-liquid), synonyms implying covert use (eg, stealth, discreet, subtle, inconspicuous) and forms of ordinal objects we knew to be adopted into vapourisers (eg, pens, asthma inhalers). We also sought other sleek vapouriser devices that emulate JUUL in their design and searched YouTube for videos illustrating ways consumers use secret devices and hide their vapour plumes (eg, hiding JUUL in school or from parents).

RESULTS
Products resembling USB sticks
As of July 2018, JUUL represents an impressive 70.5% of the entire US convenience store market for vapour products making it of unique importance among stealth vaping devices.1 Other leading brands (Vuse at 10.8%, Blu at 5.6%, MarkTen at 7.7%) either recently introduced, or plan to introduce, small stealthy pod-based devices (Alto, MyBlu, Elite). As one gauge of its popularity, a search on ‘JUUL’ on YouTube (June 2018) yielded 148 000 videos with 57 videos having >100 000 views. The company maintains that: ‘JUUL is for adult smokers seeking a satisfying alternative to cigarettes.’ Nevertheless, the device is increasingly popular among teens.1–4

Each JUULpod contains 0.7 mL of liquid with 5% of nicotine by weight or 59 mg/mL in a mixture of propylene glycol, glycerol and benzoic acid as the vehicle. This is among the highest concentration offered by e-juice vendors and approximately an equivalent dose to that contained within an entire pack of cigarettes.5 A few companies advertise JUUL-compatible pods including EonSmoke,
Airbender, Ziip Pods and Fuma. These alternative pods are usually cheaper, have nicotine content slightly lower or higher than JUULpods and are available in a wider range of flavours. Reviews of these alternative products are mixed with complaints of leakage and harsher flavouring. Google trends shopping data shows that searches for these alternative products are far fewer than searches for JUULpods. In addition, consumers sometimes try to refill their JUULpods with less expensive e-juice. The popularity of this is witnessed by a YouTube search on 'refilling JUULpods' which yielded 4830 videos. The JUUL website clearly cautions consumers against re-filling JUULpods with other liquids through the following warning statement: 'For health and safety concerns, please do not attempt to refill or open your JUULpods. To maintain product quality JUULpods are not designed for refills nor re-use.'

The extraordinary success of JUUL has led to a proliferation of other sleek vapouriser devices that emulate JUUL in their design (figure 1). Advertising of Smok Infinix, a nicotine vapouriser shows the product hidden in a woman’s handbag alongside common everyday items such as lipstick, alongside the description: ‘It has (sic), sleek appearance, the mini body can be your best partner wherever you go.’ An instructional video for Limitless Pulse Pod’s e-cigarette has instructions on activating its ‘stealth mode’ so that there is no colour illumination when you inhale. The Suorin iShare e-cigarette vapouriser is promoted on a tobacco retail website as an: ‘ultra portable system that is designed to simulate an asthma inhaler (figure 2).’ The ‘non-prescription nicotine inhaler’ contains a nicotine dose that is equivalent to about two entire packs of combustible cigarettes. Each breath from the QuickNIC device delivers 25 mg of nicotine to the lungs. The manufacturer recommends its use: ‘in situations where smoking and vaping are restricted, QuickNIC allows you to discreetly breathe nicotine.’ The product description goes on to say that the device is: ‘small, discreet and portable ... Each breath of QuickNIC is absorbed and not exhaled, so no one will even know you’re using it’. Advertising for the product is accompanied by the slogan: ‘nicotine anytime anywhere’. Inhalers are also on the market as a form of nicotine replacement therapy. Although in comparative studies oral inhalers were preferred to gums and lozenges, they are still not very popular.

Resembling pens

There are a number of brands that manufacture stealth marijuana and nicotine vapourisers that resemble pens. (figure 3) The Vape

Resembling asthma inhalers

Discreet Vape’s PUFFiT dry herb (ie, marijuana flower) and THC concentrate vapouriser markets a product modelled on an asthma inhaler (figure 2). According to the description: ‘The design was created this way on purpose so that your vaping sessions can be done in a more stealthy fashion. While other vapourisers might give you away, using the PuffIt 2 Vaporizer will ensure that your experience is both private and discreet’.

Research paper

Figure 4  VaporCup is described as a: ‘travel mug style design blends in with life to assure your privacy’. Micro Vaped FOB is described as a ‘car key vaporiser’ for ‘low key vaping’. The trunk open button is the on/off switch and the lock and unlock buttons vary the temperature.

markets a ‘Incognito Luxe Stealth Vaporizer Pen’, promoted as: ‘the type of covert device you would find in a Spy movie’. The brand prides itself in being a fully functional pen of luxurious quality. ‘Most people never figure out the true nature of this duplicitous device, even after writing with it for days.’ The pen is compatible with e-juices, as well as with marijuana concentrates and oils. Micro Vaped V4 Vaporizer Pen is a marijuana concentrate vaporiser described as a: ‘fine writing pen for discreet vaporization’. VaePlume’s Discreet Vaporizer Pen is marketed as ‘discretion in form and function’. According to the product description it is for: ‘social, sophisticated, and professional individuals who are actively breaking ‘the stoner’ stereotype’. The product: ‘allows you to practice discretion in living your lifestyle’. The Grasshopper’s pen vaporiser is described as: ‘born out of a need for a great portable vaporizer’. The device also has a top button that turns the device on and off.

Resembling a mobile phone
The Suorin Air Pocket Vape, a slim e-cigarette vaporiser, produced by Foxconn, is advertised, as: ‘so small that it can fit in your pocket and even your wallet... Smaller than the average smartphone...’ E-cigarette manufacturer Veppo, which also brands and sells the Suorin vaporiser, says the Suorin Pod Vape gives: ‘new meaning to the idea of covert vaping’. Veppo markets the Suorin product as: ‘Mini size. Huge freedom’ and the ‘modern stealth vaporizer’ (figure 6). The DaVinci Ascent marijuana vaporiser resembles a flip phone and is described as: ‘sleek, stylish, and discreet’.

Resembling a coffee cup
VaporCup manufactures a marijuana vaporiser in the form of a coffee travel mug describing it as: ‘designed for discreet use’ (figure 4). The mug comes with a removable ‘privacy sleeve’ to mask its digital display. VaporCup is marketed as a: ‘travel mug style design blends in with life to assure your privacy’.

Copyright.

Figure 5  Vaporisers which resemble small electronic devices such as a remote control, MP3 player or iPod.

Resembling small electronic devices
Several vaporisers resemble small electronic products such as the MP3 player, voice recorder or remote controls (figure 5). Cloud V’s F17 marijuana vaporiser is described as a: ‘discrete, portable and functional... and it fits in the palm of your hand’ with its cap on Eleaf’s iCard nicotine delivery device resembles an iPod. The device is available in bright colours that brings to mind highlighters. Other examples of devices that resemble electronic devices include the e-cigarette brand My Von Erl and PAX 2 and PAX 3 which are dry herb vaporisers (ie, vaporisers of dried tobacco leaf or marijuana).

Resembling car fob
Micro Vaped manufactures a marijuana vaporiser that resembles a key fob commonly used in automobile for on-the-go stealth vaping (figure 4). The lock and unlock buttons, instead of opening a car door, are used to switch from the six predesigned heat settings. The button with the trunk opening icon is the on/off switch. The brand markets the vaporiser as the ultimate in ‘low-key’ vaping.

Figure 6  ‘Suorin Air is a credit card-sized device marketed a ‘modern stealth vaporizer’. Hidden within a candy dispenser, tictac-toke is marketed as ‘The ultimate stealth device’.

The Ultimate Stealth Device??

Cloud V F17  My Von Erl  Pax 3  eLeaf iCard
Resembling candy container
Affordable Mods offers the tic-tac-toke marijuana vaporiser in which the vaping apparatus is secreted within a Tic Tac candy container. The container is divided into two parts, with one containing the vape generator and battery and the other filled with actual Tic Tac candies (figure 6).

Wearable devices
Vaprwear manufactures a line of hoodies and backpacks that promote: ‘discreet, hands-free vaping integrated into wearable products’. Their discreet vaping designs are marketed with the slogans: ‘easy vapor delivery anywhere, anytime’, ‘more than meets the eye’ and ‘it’s gear with a higher purpose’. The later slogan connotes potential use for THC containing vapours. The ‘stealth hoodie zipper’, available in styles for both men and women, comes with a drawstring that contains the following: a concealed battery, e-juice cartridge, vaporiser and extendable mouth piece. The system is connected by a ‘medical grade hose system’ (figure 7). The brand also manufactures the ‘HydroVape backpack’. According to the manufacturers, the backpack is designed for ‘active lifestyles’ and is constructed with enough room for: ‘gear or a laptop and school supplies (bold added)’.

Vaporisers with ‘stealth’ their brand name
The Kado Stealth is a nicotine vaporiser that promotes itself as: ‘the next small thing in vaping technologies’. According to the brand, its mission is to: ‘create ergonomic and portable products while maintaining a contemporary and discreet design suited for any lifestyle or occasion’. The brand uses modern designs that: ‘leave no trace behind’.

A number of vaporisers have product names suggesting they are discreet or stealthy, even though they have similar appearance to other vaporisers on the market and possess no distinguishing covert features. The Zig-Zag Stealth Vaporizer, while it carries a name connoting an inconspicuous design, is shaped like a typical cigarette. The Kind Pen vaporiser named Discreet is a fairly typical rectangular box with a prominent mouth piece. Other brands in this category includes Vape Ape’s Stealth Skillet, Kind Distribution’s Stealth Blomber and TeslaCig’s Stealth Mod.

Low vapour
Inconspicuous vaporisers, or the e-juice they use, may be designed to de-emphasise the vapour they produce. For example, the vapour produced by JUUL is relatively subtle. Makers of e-liquids also market inconspicuous vapour products, with a greater concentration of propylene glycol and less glycerin. Adding water to dilute the vapour is another method. To diminish this tell-tale sign of vaping, Jac Vapour markets Clear Steam Vapourless brand of e-liquid that they claim leaves behind little visible cloud (figure 8). White Cloud Electronic Cigarettes manufactures Invisivapor liquid cartridges which are described as ‘especially innovative as it produces almost no noticeable vapour at all, which makes it ideal for public use.’

Techniques for secreting vapour plume
The vapour plume may be hidden by any number of techniques. The ‘deep inhale’ method takes advantage of the fact that vapour that is held into the lungs for longer periods becomes less prominent. The second inhale technique involves a subsequent inhalation of air to dilute the vapour. Swallowing the vapour during exhalation is yet another method. A student recommended on YouTube exhaling into a backpack or under clothing. Exhaling into a napkin or paper towel has also been recommended.

Low odour e-juices
One aspect of stealthiness is low odour. Due to vaping flavoured e-juices, some school bathrooms have been said to smell like fruit stands. The odour JUUL produces has been described as: ‘subtle and could easily be mistaken for a lotion or body spray’. There are also flavourless e-juices available on the market which claim that they have ‘no fragrance’. Manufacturers of Suorin Air note that the smell of the: ‘vape dissipates after a few minutes’.

Figure 7  The Vaprwear HydroVape backpack (above) has the vapour delivery system built into the shoulder strap. The Vaprwear ‘stealth hoodie zipper’ (below) secretes all components of the vaporiser within its drawstring.

Figure 8  E-juice brands manufacture low visibility e-juices that de-emphasise the vapour they produce to promote stealth vaping.
Vaporisers have also been touted as enabling use of THC oils without the distinctive hemp odour of marijuana. The brand Wake Vape’s Stealth e-liquid is described as a mixing agent that can hide the smell of marijuana concentrates with the e-juices citrus described as: ‘Scientifically formulated to mask the potent smell of herbs’. Locations for discreet vaping
There are multiple reasons for a consumer to engage in inconspicuous vaping. An obvious one is that it is a way of getting a nicotine or THC dose in a place where smoking and vaping are not permitted. YouTube searches on ‘vaping at work’ (80 100), ‘vaping at the airport’ (4940), ‘vaping in a hospital’ (7000) and ‘vaping in church’ (5920) illustrate the popularity of stealth vaping. JUUL is also heavily represented in these categories (table 1).

Stealth vaping among youth
Much attention has been focused on the popularity of stealth vaping, especially JUUL, among youth. The widespread use of JUUL among students is illustrated by the number of YouTube videos related to JUUL use at school (table 2). By way of illustration, a large number of YouTube videos are of this genre: for example, ‘JUUL at school’ (15 500), ‘JUUL in class’ (6840) and ‘JUUL in the school bathroom’ (1040). Of most direct relevance to stealth vaping were the YouTube videos describing ‘hiding JUUL: ‘in school’ (2030), ‘from teacher’ (531), ‘from parents’ (1990) and ‘at home’ (1230).

DISCUSSION
An individual seeking to vape covertly needs to consider several factors that reveal the activity. The first is the device itself, most of which either come in sizes and shapes reminiscent of cigarettes, large cigars or boxes with nipples making their purpose rather obvious. The second is the vapour plume which is often more prominent than with a traditional cigarette. The third is the residual smell which may be distinctive, particularly for sweet and fruity flavours.

The devices described in this paper illustrate the creativity of vapour device manufacturers in designing vaporisers cloaked to disguise their actual purpose. While most of these devices employ e-liquids containing nicotine, some are capable of delivering THC via liquid, oil or even dried flowers. One common feature of stealth vaporisers is that they either lack a mouthpiece, which would be an obvious giveaway, or have a retractable nipple. Most are cleverly designed to emulate ordinary objects such as USB memory sticks, pens, MP3 players, cell phones, coffee mugs, car fobs or even candy dispensers. Most are small enough to be secreted into a pocket or purse. Numerous YouTube videos, with their impressive number of ‘likes’ testify to the popularity of discreet vapour devices, especially among youth who often use them in schools. While the primary focus of this paper is commercially available stealth vaporisers, consumers sometimes make postmarket modifications to enhance the stealthiness of their devices. Individuals hollow out commonplace items such as Sharpie markers, TV remote controls, game controllers and so on (figure 9).

Clandestine smoking in school has a long history as illustrated by the popular 45-year-old song by the group Brownsville Station: ‘Smokin’ in the boys’ room’ (1973). Given the ready availability of inconspicuous devices and plume-reducing methods, inhibiting school vaping is a challenge. To curb stealth vaping, principally aimed at curtailing the JUUL craze, some schools have banned flash drives. Concerned about the frequency of vaping in school bathrooms, districts are seeking to counter the trend. Yorktown High school went so far as to remove the main doors from student bathrooms to dissuade vaping. A number of high schools in New York recently began testing vapour detectors using sensors marketed by a school safety company, Digital Fly. Noting the rapid rise of tobacco-related disciplinary actions, a metropolitan Chicago school district plans on installing vapour detectors in washrooms.

Use of traditional cigarettes among US high school student dropped from 15.8% to 7.6% between 2011 and 2017 while e-cigarettes increased from 1.5% to 11.7%. In 2014, American high school students used vapour products more than combustible cigarettes for the first time. Given the exceptional rise of JUUL use by teens since its introduction in July 2015, the per cent of high school students using e-cigarettes is likely higher in 2018. JUULpods use nicotine salts which according to the manufacturer allows the nicotine content to be quickly absorbed. Among 30-day users of JUUL ages 15–24, only 37% were aware that JUUL always contained nicotine. JUUL’s high nicotine concentration raises concern that it is serving as a gateway to nicotine addiction among a sizeable number of adolescents. Studies show that nicotine-addicted teen vapers often adopt use of more dangerous combustible tobacco types. The rising use of vapour devices in schools may portend use of other substances. A study found that adolescent smokers who reported smoking on high school property were nearly three times more likely to engage in binge drinking and nearly four times more
in February 2018 JUUL entered the Israeli market with its 59 mg/mL nicotine product. In July 2018, JUUL was launched in the UK with 20 mg/mL nicotine pods to be compliant with the European Union Tobacco Product Directive standards. Israel is considering adopting the European standard.

Alerted by the rapid rise in JUUL use among American students, in April 2018 the US Food and Drug Administration undertook ‘enforcement actions’ against retail establishments selling JUUL to youths. Letters were sent to JUUL Labs, requesting the company’s documents with regard to product marketing, product design and research on health, toxicological or behavioural effects. This information might help to explain the youth appeal of their product.

What this paper adds

- Stealth vaping devices enable covert use of nicotine and THC.
- A variety of vapour devices have been disguised as ordinary items such as USB sticks, pens, remote controls, car fobs, smart phones, sweatshirt drawstrings and even asthma inhalers.
- The extraordinary popularity of JUUL among teens may be due in part to the fact that parents and teachers do not recognise it as a vaping device.
- Stealthiness includes e-juices which are marketed for their low visibility plume and/or subtle odour.
- YouTube videos describe numerous techniques for secreting the exhaled plume by exhaling under clothing or into backpacks, often in the school setting.

Figure 9  Teens are creative in inventing ways to hide their vapour devices to avoid discovery by parents and teachers. A number of YouTube videos illustrate how to hide a JUUL in a Sharpie marker, one of which has >35 000 views.

likely to smoke marijuana or use cocaine compared with student smokers who did not smoke on campus.

Regulators seeking to reign in stealth vapour devices face challenges. Technically, defining the concept of stealthiness is difficult. Even were current generation vapourisers restricted from the marketplace, such as those shaped like USB devices, companies could innovate in myriad ways to circumvent any such regulation. In addition, postmarket modification by consumers to disguise a vaping device cannot realistically be controlled.

This study has some limitations. Stealth devices and e-juices were captured at a particular window of time and, although it covers the representative types, it does not represent the entirety of the market. In addition, the stealth device market is undergoing rapid change, and some of the products offered by the brands during the period of data collection may not be available at the time of publication of this paper. The number of YouTube videos retrieved from searches are sometimes inflated by off-topic videos. A study of JUUL’s marketing found that 80% of YouTube videos retrieved in the search results were related to JUUL e-cigarettes.

To date, JUUL has been nearly exclusively an American phenomenon. In its first foray into a market outside of the USA,.
