Indigenous peoples represent a diversity of cultures, perspectives and experiences that brings tremendous vibrancy to our world. Within this diversity, many Indigenous peoples share a common history of colonisation that continues today.¹ We humbly acknowledge and respect that Indigenous people are diverse and constitute many nations, language groups and cultures. For the purposes of this commentary, Indigenous peoples include self-identified individuals and communities who have historical continuity with pre-colonial/pre-settler societies; are strongly linked to their natural environments; and often maintain their own distinct language(s), belief and social systems.

In 2017, Philip Morris International (PMI) provided US\$1 billion funding for 12 years to establish the Foundation for a Smoke-Free World (the Foundation). The stated purpose of the Foundation is to help achieve a ‘smoke free world’.² According to the Foundation’s Strategic Plan, ‘ending smoking’ means eliminating use of the cigarette and other forms of combustible tobacco, while ensuring populations affected by this transformation are supported to find sustainable alternative activities and products.³ The research agenda includes a focus on an alternative nicotine product version of ‘harm reduction’. In August 2018, the Foundation provided a US\$1 million grant that created a New Zealand-based Centre for Research Excellence: Indigenous Sovereignty and Smoking (the Centre) whose stated aim is to focus on reducing smoking-related harms among Indigenous peoples.^{4,5}

Are the interests of Indigenous peoples truly being served by promoting the research agenda of a tobacco industry-funded Foundation? We do not think so, for several reasons. While improving help for people to cease commercial tobacco use does have potential to reduce the harm from smoked tobacco use, evidence suggests that individually targeted interventions that are essentially palliative and require a significant level of individual agency do not actually address the root cause of the problem.^{6,7} As such, they do little to address smoking disparities between Indigenous and non-Indigenous peoples. This is demonstrated in papers that have found that despite decades of high-quality population-level (eg, the New Zealand Quitline and media campaigns) and

targeted cessation interventions (eg, the Auakati Kai Paipa Smoking cessation services), smoking among New Zealand Māori remains unacceptably high.^{8,9} It was Māori in Aotearoa (New Zealand) who first advocated for a Tupeka Kore (tobacco-free) country¹⁰ and emphasised the need to shift attention away from individuals to the true source of the problem: commercial tobacco and the companies that sell and promote it.¹⁰

Improving physical health is a priority for Indigenous peoples, but this is usually set within the broader context of Indigenous health and well-being that connects physical, psychological, social and spiritual health.¹¹ The proliferation of alternative nicotine devices (ANDs) and the potential they may hold for improving Indigenous health is a hotly debated topic,^{12,13} and the control of this debate needs to be led by Indigenous peoples and not influenced by external pressures, particularly from organisations that are linked to the tobacco industry.³ The prevalence of commercial tobacco use in the general population of Australia, Canada, New Zealand and the USA is 16%, 18%, 16% and 16%, respectively.^{14–18} This is in contrast to the high rates of commercial tobacco use among Aboriginal and Torres Strait Islander peoples in Australia (41%), First Nations (40%), Inuit (49%) and Métis (37%) peoples in Canada, Māori in Aotearoa (35%) and American Indian or Alaska Native in the USA (32%)^{14–16,18,19} which is in each case substantially higher than their non-Indigenous counterparts.

As others have detailed,^{20,21} the Foundation cannot be regarded as independent from its tobacco industry funder, and its work serves to advance the industry’s goals. While PMI has claimed it wants to ‘end smoking’, it continues to promote use of cigarettes. By serving the interests of PMI, the Foundation is complicit in commercial tobacco use and the associated absolute and disproportionate tobacco-related harms to Indigenous peoples.^{9,22}

MODERN COLONISATION

Colonisation is not a historical artefact and it continues contemporaneously at both country and global levels. Indigenous knowledge, values, behaviours and protocols have been suppressed (or sometimes appropriated) through colonisation processes, implemented by governments, churches

and other institutions.^{23–26} However, Indigenous peoples remain steadfastly resistant and resilient in the face of colonisation in its many forms.²⁴ The global promotion of commercial tobacco and the subsequent addiction of Indigenous peoples to nicotine products is a modern form of colonisation. Colonial forms of oppression include, but are not limited to, forced removal and relocation of Indigenous peoples from their land, removal of Indigenous children and using commercial tobacco as a form of payment prior to engagement with the cash economy.^{24 27} For example, tobacco was issued as rations on missions in Australia.²⁷ Further, among some Indigenous peoples, the modification, transformation and commercialisation of the nicotiana tobacco plant belittles and disrespects something which is held sacred.^{25 28–31} Thus, commercial tobacco and any of its derivatives represent a threat to physical health, as well as spiritual health and well-being. In fact, given this understanding regarding the modification, transformation and commercialisation of the nicotiana tobacco plant^{25 30} and the strong evidence base of commercial tobacco-related addiction and ill-health, tobacco industry-funded research activities can be seen as a form of contemporary colonisation.^{9 29 32} This form of contemporary colonisation can be seen as a result of using culturally inappropriate protocols, assimilative practices and a raft of colonisation tools and processes, distorting Indigenous realities and creating an inaccurate Indigenous narrative that promotes Indigenous health harms and perpetuates oppression.

The tobacco industry's role in purporting to support health research, while also profiting from selling commercial tobacco products, creates a conflict of interest. Therefore, tobacco industry funding of 'health' research either directly or indirectly, including via third parties, should be vigorously resisted. This is underscored by the Framework Convention on Tobacco Control, which states the Parties are "deeply concerned about the high levels of smoking and other forms of tobacco consumption by indigenous peoples" (FCTC, Preamble),²² page 2 and urges that tobacco industry influence be resisted.

Others have commented on the disconnect between PMI funding the Foundation as an act of social responsibility and their continued advocacy for, and sales of, tobacco.^{20 21} Further, the effects of the Foundation's funding of the Centre appear to include (1) legitimising the Foundation, including the use of Indigenous imagery in promotional material; (2) legitimising PMI as being a responsible corporate citizen that cares about Indigenous peoples; and (3) creating and exploiting division among Indigenous peoples as well as the health sector by exploiting differences in views around ANDs. While Indigenous views on ANDs are diverse, our lives are complex, and simple individualised solutions, such as targeted smoking cessation interventions delivered in isolation from the larger context of community life, do not necessarily take this complexity into account.³³

Indigenous peoples experience disproportionately high rates of commercial tobacco use, and consequently disproportionately high rates of tobacco-related death and disease.⁹ PMI appears to be interested in building a veneer of social responsibility, so that it can bolster corporate credibility and leverage this to influence political debates about tobacco control policy.^{7 34} If PMI was serious about its aims for a smoke-free world, it would cease its opposition to evidenced-based measures to reduce smoking rates, such as advertising bans, tax increases and plain packaging. Further, the tobacco industry would cease commercial tobacco manufacturing,

marketing, lobbying and litigation. The tobacco industry has a long history of deliberately colluding in covering up, denying, confusing and questioning the science on smoking-related morbidity and mortality.³⁵ As a business, PMI's goal is to safeguard and extend shareholder profits, thus it is rapidly expanding into the lucrative AND markets. PMI has never demonstrated genuine concern for the health and well-being of Indigenous peoples, and has a history of ignoring and undermining scientific evidence.³⁶ The tobacco industry's interest in Indigenous peoples has been to appropriate our names and imagery^{31 37} along with the tobacco plant itself, with the sole intent of furthering tobacco sales and profits. Despite this history, the Foundation continues to claim that their agenda is not influenced by PMI.^{2 38} The Foundation states that it "cannot engage in activities designed to support PMI's interests",² and is apparently seeking to associate with Indigenous organisations, researchers and peoples worldwide.⁴ But simply by existing and being embedded within PMI's funding strategies, the Foundation is supporting PMI's interests.²¹

Arguably, PMI funds the Foundation to create divisions among those who are working towards a smoke-free world.^{20 21} For example, tobacco industry documents proved that the industry has long known about the health effects of smoking, the danger of secondhand smoke and the addictiveness of nicotine but deliberately colluded in covering up, denying, confusing and questioning the science demonstrating smoking-related morbidity and mortality.³⁵ The arguments about who to trust and who researchers should accept funding from can dilute the health sectors' efforts, create confusion, throw doubt on who should be believed and create further opportunities to promote the tobacco industry agenda.^{3 34} This replicates a common tool of colonisation: divide and conquer.³⁹

HISTORY OF EXPLOITATION AND APPROPRIATION

PMI has a history of exploiting and appropriating Indigenous names and imagery to sell its products, including selling 'Māori Mix' in Israel.³⁷ It also has a long history of opposing sovereign governments implementing tobacco control legislation and policies that will protect the health of their citizens.^{20 35} In so doing, PMI exerts its corporate sovereignty over the rights of Indigenous peoples to continue selling tobacco products in their countries, even when they are not wanted.¹⁰ It is well documented that PMI and the tobacco industry use tactics of focusing on 'individual choice' to redirect blame. However, framing tobacco addiction as 'individual choice' conveniently shifts the policy focus and 'commonsense' discourse away from the issues of tobacco supply and industry profit.^{34 40} For Indigenous peoples, these acts can be seen as attempts to suppress our collective voices.³⁹

KA MUA, KA MURI (MĀORI PROVERB: LOOKING TO OUR PAST AS WE MOVE IN THE FUTURE)

In supporting the Centre, the Foundation President, Dr Derek Yach, released a video in which Indigenous peoples were referred to as 'vulnerable and off the beaten track'.⁴ Indigenous peoples have endured colonisation, but this does not define us. Portraying Indigenous people in a negative light, as marginalised and lacking power, is a classic tool of colonisation. In contrast, for many Indigenous peoples, resilience and resistance have kept our culture alive and our communities are thriving. We hold on to our traditions and the deeds of our ancestors as we move to the future and the potential it holds.

Indigenous peoples are strong, practical and innovative. We have a range of views on the role of emerging technologies, such as ANDs, in helping achieve our health and well-being goals. But the use of ANDs is not and cannot be an end point. Much of the tobacco control discourse extolled by the Foundation sits within a biomedical view of health, focusing on individual physical health.^{2 3 11 38} Indigenous health and well-being is more than physical health¹¹—it is about the ways Indigenous people may relate to the tobacco plant, about our spiritual essence, and about fostering an environment for our traditions and culture to prosper.^{11 13 25 29} Committing current and future generations to lifetimes of nicotine dependence has significant health and well-being implications. This is where the Foundation's agenda and PMI's agenda align, and Indigenous health (as well as broader public health) agendas do not. As outlined in the Foundation's Strategic Plan³ page 2, they are "...seeking to engage industry to accelerate the shift away from cigarettes towards less harmful forms of nicotine. The ecosystem is capable of transforming today because of innovations in digital consumer technologies and in products that deliver nicotine without the harmful chemicals created by burning tobacco". PMI wants current and future generations to use commercial nicotine products. For Indigenous peoples, our future lies in ridding ourselves from the physical, social and spiritual harms caused by commercial tobacco use and nicotine addiction.

CONCLUSION

Indigenous peoples should not accept tobacco industry funding. Whether it is explicit or implicit, the tobacco industry will use the Foundation to meet its agenda which is in stark contrast to the health and well-being agendas of Indigenous peoples. Indigenous communities and the public health sector must act now to resist co-optation of Indigenous culture, seek a genuine end to nicotine addiction among our peoples and unify against the industry. The health and well-being of Indigenous peoples is too critical, the promise of future Indigenous generations too important.
